THE Daily Chronicle complains that provincial cities are falling an easy prey to the "seductive cheapness" of the system of overhead electric tramway traction. Neither the conduit nor the surface contact method have yet received a fair trial. The last town where the overhead system is recommended for adoption is Nottingham, which is now working its municipal tramways, and proposes to spend nearly half a million on extensions. The alternative systems considered were underground conduits, accumulators, and cable. Cable traction was at once rejected on the ground of its expense. The conduit electric system is also costly and uncertain. Accumulators are not making any progress, and cost three times as much as the overhead system. The only possible objection to the overhead system has, says the tramway committee, been greatly exaggerated. The poles can be made ornamental, and the danger from the wires had been "greatly magnified."

ARRANGEMENTS are now rapidly approaching completion for the opening of the electric railway which connects Waterloo Station of the London and South-Western Railway with

the new Mansion House Station. The line is, perhaps, for its size, one of the most remarkable from an engineering point of view that has been constructed within the metropolis. It is only about two miles long, but in that distance it burrows under the Thames, beneath St. Paul's Cathedral, and partially undermines the Mansion House. It has only two stations, but each of these is constructed on perfectly novel principles. That at Waterloo is immediately under the terminal station, and access is had to it from the platform level by means of a series of stairways connecting with a corridor tunnel running round the whole area of excavations. Extraordinary care has had to be exercised in carrying out the work to avoid interfering with the stability of the terminus, but by an elaborate system of underpinning all danger of subsidence has been averted, and in the result the engineers are able to show one of the most curious and interesting pieces of work that the railway system of the country can boast of.

At the Mansion House end equal skill has been exercised in the construction of the station. Here the superstructure was not a railway terminus, but a church—that of St. Mary Woolnoth—and extensive underpinning had again to be resorted to. The edifice, in fact, now rests upon a series of iron columns and girders whose foundations go deep into the bowels of the earth. The station itself will be nearly 100ft. below the level of the street. It will be reached by means of a shaft 75ft. deep and 24ft. wide, from a platform 20ft. below the level of the church. The booking office and waiting-rooms will be on the platform, and five lifts of novel construction will convey passengers to and from the trains.

MR. LABOUCHERE and Mr. G. Shaw Lefevre are in disagreement concerning the proposal to erect a monumental chapel as an annexe to the Abbey. Says Mr. Lefevre in a letter to the Times:—"I observe with satisfaction that he (Mr. Labouchere) no longer assumes an attitude of implacable hostility to the scheme of a monumental chapel as an annexe to the Abbey. Indeed, the fault he finds with my last proposal is that it is not extensive enough. He thinks that the sites of more houses in Abingdon Street should be taken for it, and that the site of his own house should be laid down in turf! The scheme he suggests is not very different from that originally contemplated by the committee of 1887, and which was modified later, when Mr. Pearson was consulted. It was thought, among other things, that Abingdon Street was too distant, and that the nearer the chapel was to the Abbey the more it would be considered a part of it. When Mr. Labouchere says that there is not room on the site of his house, between it and the Jewel Tower, for a sufficiently imposing building to harmonise with the Abbey and Chapter House he must pardon me for preferring the opinion of the late Mr. Pearson, the highest authority on such a subject since Sir Charles Barry, and who, as architect of the Chapter of Westminster, was in a very responsible position as regards the Abbey."

WE give an extract from a sermon by the Bishop of Clonfert, preached on the recent occasion of the laying of foundation stones of a new Catholic Church at Tallamore:—"Go to England. You will find there in many towns beautiful cathedrals designed by the genius of Catholic art and building the munificence of the Catholic kings, and princes, and people of England in innocent days. Go into them: they are still beautiful, so far as human power and human art can make them so; but there is no altar there, no Divine Presence there, there is no power to preach there, there is no sacrifice there as there once was. Beautiful buildings they are assuredly, but they are wells without water, they are bodies without the spirit which has flown; they are mere husks, because the Divine Presence and the Divine Power have fled, and they can participate in none of these things."

THE Hornsey District Council has spent about £30,000 in carrying out its scheme of

municipal cottages for working men. The cottages, 108 in number, are attractive in appearance, and form a little colony under the shadow of the Alexandra Palace. Each cottage is self-contained, and has a garden plot in the front and 50ft. of land in the rear. We know of no other municipal authority which has provided cottages containing sitting room, dining room, scullery, larder, and two bedrooms and large garden for 6s. 6d. per week, or with an additional room for 8s. 6d. Two roads have been made across the estate, and the streets, which are 45ft. wide, will be lined with trees. The cottages adjoin a new Board school, and the position is such that it will not in any way interfere with, or detract from, the better class property in the neighbourhood.

An effort is being made to restore the old parish church of Ryther, in Yorkshire. The church is very ancient, and its styles of Architecture, still to be seen, are Saxon, Norman, Early English, and decorative. The little village of Ryther, which is on the west bank of the Wharfe, is a mile or two from Cawood, and has a history of about a thousand years. The Danes in the course of their invasion of the North in the ninth century were its founders, and gave it the name of Riodr, which in their language signified a clearing. Two centuries afterwards it was recorded in the Domesday Survey that there were here a priest and a church, and it is interesting to note that the chancel arch of that church is standing to-day. There is some reason to think that all besides this arch having perished, a Norman church was built soon after the Conquest, and this having passed away, with the exception of one doorway and a few carved stones, the present nave, Early English in style, was built on to the old chancel arch. There was added, probably by Sir William Ryther, Knt., a chantry, in which was placed, between the years 1300 and 1520, five of perhaps as interesting monuments as are to be found in any church in the county, two of them furnishing examples of the armour, and two patterns of the ladies' dresses of their respective periods; while the fifth has on it some beautiful specimens of carving. The later knight's effigy is in alabaster, and that of one of the ladies in statuary marble. The church, though simple in style, has in former years had beauty and merit of its own. It was, however, about 120 years ago, sadly defaced by being covered with an unsightly one-span roof and a ceiling, and until its restoration was commenced in February last, the church was most grievously out of repair.

THE Princess Christian has opened the new school which has been erected by the governors of the Stepney and Bow Foundation. The new building, which stands on the site of Nos. 31 and 33, Bow Road, is in place of the temporary school formerly carried on in the same thoroughfare. It forms a complete block, the external portion being faced with red bricks, with Portland stone dressing, while in the interior are twelve spacious class-rooms, commodious laboratory, dining-room, and offices, planned to accommodate 300 girls. The contract price for the erection of the building was £13,000.

At a sitting of the Consistory Court of London, before Dr. Tristram, Q.C., Chancellor of the Diocese of London, a petition was presented for a faculty to sanction alterations and improvements in the Church of St. Giles, Cripplegate. It appeared that it was desired to remove the organ from the east-end of the north aisle and to rebuild it at the east-end of the south aisle, sinking a portion of the new organ to a depth of about 7ft., so as to avoid obscuring the monuments on the east and south walls of the church. It was proposed to fill in any vaults which might be found under the site of the present organ, and to utilize a portion of the site as a chamber for hydraulic engines for the organ in the south aisle. It was also intended to devote the space gained by the removal of the organ from the north aisle to the accommodation of

the Communion table, carved wood, and monuments from the church of St. Bartholomew, Moor Lane, which, under the proposal for the union of the vicarage of St. Giles, Cripplegate, and St. Bartholomew, were to be transferred from the latter church to the parish church of St. Giles. The cost of the alterations and improvements was estimated to be about £1700.—The Chancellor granted the faculty, ordering that, if any human remains were found under the site of the present organ, the faculty would provide for their being removed to the crypt of the churchyard, subject to such sanitary regulations as should be approved of by the Medical Officer of Health.

THE Romans constructed their main roads to last for ever, says the Carriage Monthly. They are true monuments, made of siliceous and calcareous materials, far superior to the highest type of modern work. The superstructure was a roadway, generally very strongly convex, and two side paths or footways. Near Rome the full width was often 20 metres, but not usually. From 3 to 3½ metres for the smaller roads, and from 4 to 4½ metres for the larger, are dimensions that have been generally noted. In mountain regions the road was narrowed to a single carriageway, 1½ metres. The sidewalks were large near the cities, but reduced to six-tenths of a metre in the outer districts. These were built of cut stone, at least on the border. At every twelve paces (18 metres) mounting stones were placed. At every 1000 paces (1481 metres) milestones were erected. In one instance the roadway was divided by a low wall down the middle, as if to surely establish two streams of traffic. Some of the best roads were paved with marble. The minor or secondary roads were not so carefully made. In the construction of the wagon road a ditch was dug to the solid earth, which was stamped or rolled, or even stake driven if necessary, then, on a floor of sand, 10 or 15 centimetres thick, a layer of mortar was placed, after which they placed successively four layers, as follows: Statumen.—The support or foundation. A course of several layers of flat stones, bound by hard cement, or, failing in that clay. This layer was usually 30 centimetres thick, and twice that in bad lands. Rudus.—A concrete of pebbles, stones or broken bricks strongly stamped together with iron-sheathed stampers. This layer, when finished, was usually 25 centimetres thick. Nucleus.—A layer of 30 to 50 centimetres of gravel or coarse sand, finer than the third layer, and rolled successively in small layers. Summum dorsum (summa crusta).—A convex layer, 20 to 30 centimetres thick or more, made somewhat differently according to the materials at hand. It was either paved with cut stone or laid with pebble and granite or metalled.

A MODEL of the City of Rome in the thirteenth century would afford us the strangest picture. Rome resembled a huge field encircled with moss-covered walls, with tracts of wild and cultivated land, from which rose gloomy towers or castles, basilicas and convents crumbling to decay, and monuments of colossal size clothed with verdure; baths, broken aqueducts, colonnades of temples, isolated columns, and triumphal arches surmounted by towers; while a labyrinth of narrow streets, interrupted with rubbish heaps, led among these dilapidated remains, and the yellow Tiber, passing under broken stone bridges, flowed sadly through the ruinous waste. Round the city, within the ancient walls of Aurelian, were tracts of land, here waste, there cultivated, resembling country estates in their extent. Vineyards and vegetable gardens lay scattered like oases through the whole of Rome, in the very midst of the present city. . . . Everywhere that the eye rested might be seen gloomy, defiant battlemented towers, built out of the monuments of the ancients. . . . These were the castles and palaces of Guelf and Ghibelline nobles who sat thirsting for battle, in ruins on the classic hills, as though Rome were not a city, but an open territory, the possession of which was to be disputed in daily warfare.—His-

tory of the City of Rome in the Middle Ages," by F. Gregorovius.

THE Post Office authorities have laid about forty miles of the large telephone and telegraph trunk line cable which is to extend from London to Birmingham. The laying of this cable is by far the largest piece of work the authorities have undertaken since they had control of the telegraphs. The cable, which is being manufactured by the British Insulated Wire Company, at their works at Prescott, has a total diameter of 2½in., and the weight of each mile of cable is about 22 tons. It is made up of seventy-six separately insulated wires, each mile of which weighs 150lb. The manner in which the cable is constructed is interesting. Each conductor is separately enclosed in a tube of paper, so that it is entirely surrounded with air. The object of this is to get as much air round the conductors as possible without increasing the size of the cable. Air has a lower capacity than any known substance, and low capacity on a cable is equivalent to small absorption of current. This means that speaking is possible over a greater distance than under any other circumstances, and it was not until a cable was invented on this principle that it became possible to speak over any considerable distance by means of underground wires. The ordinary overhead wires are, of course, always surrounded by air, and this is why speaking is possible over such great distances, but long lines and many wires, "cross talk," and the danger of breakage render this system very troublesome and expensive. On the new cable the conductors are made up in pairs, the wires stranded together round one another, and the whole covered with a heavy sheathing of lead. At intervals of five miles pillars are erected, and at these points dry air is to be forced through the spaces into the cables, so that if the lead sheathing should become punctured the presence of the hole will be instantly discovered.

SOME interesting "bits of old Bristol" have disappeared from the top of the Pithay, where new business premises are being erected. One of the most picturesque of the old houses was the premises built at the time of the Commonwealth, which was conspicuous from Wine Street. This exists now only as a memory, but, fortunately, the old coat of arms that adorned its front is preserved at the Museum. It is believed that Thomas Harris, living in the adjoining property, erected the old house now demolished, and adopted the "brewer's arms," referred to for external decorations. Mr. J. E. Pritchard, in a paper read last year before the Antiquarian Club, states that the Pithay derived its name from "Pit-lodge," or "Well-close," and the old cluster of houses was originally just outside the earlier or inner wall of the city, and built upon the descent of the hill that trended down to the river From.

THE long-deferred response to the petition of the vicar and churchwardens of Liskeard for a faculty from the diocesan authorities to enable the dilapidated tower of the parish church to be rebuilt, was received a few days ago. A citation has been forwarded for exhibition on the door of the parish church, setting forth in the quaint phraseology used in these ecclesiastical matters, the circumstances as stated in the petition, under which a faculty was asked for. The vicar and churchwardens it is said, have represented by their petition to the Lord Bishop of Truro that the tower of the parish church of Liskeard was in a very precarious and dilapidated condition, and had recently become so dangerous that the petitioners, acting on the report of the borough surveyor, and with the consent of his lordship's vicar-general, removed the upper portion thereof and the six bells. It was now proposed, in accordance with plans prepared by Mr. John Sansom, architect, of Liskeard, to take down the remainder of the tower of Liskeard Church and rebuild the same, and also to erect a choir vestry, insert a west window, and remove and raise the tower arch, &c., at an estimated cost of £3500. Thus the diocesan authorities have consented to permit the rebuilding of the tower of Liskeard Church.

R.I.B.A.

THE ROYAL GOLD MEDAL, 1898.

PRESENTATION TO PROFESSOR AITCHISON, R.A.

THE Royal Gold Medal of 1898 for the promotion of Architecture has been presented to Professor Aitchison, R.A., President of the Royal Institute of British Architects, for his works as an architectural writer, and for his executed works as an architect. The presentation was made at a meeting of the Institute on Monday night by Mr. F. C. Penrose, F.R.S., who is Mr. Aitchison's predecessor as President of the Institute. Mr. Penrose, in presenting the gold medal, gave the following personal details of Mr. Aitchison:—Our President's father was an architect, and appears to have destined him for the profession from the very first. There have been, no doubt, cases where this "predestination," if I may call it so, has had an unfavourable effect, and some of the most brilliant careers (of which those of Lord Leighton and the President of the Royal Academy are instances) have been of those whose natural bent opposed itself successfully to

PARENTAL PROPOSALS.

But exceptions do not prove a rule, and it is evident that in general the rule has worked well, as it certainly has in the case before us. Mr. G. Aitchison, senior, up to the time of his death, was architect to the St. Katharine's Dock Company. His practice was mainly in wharves, warehouses, and offices, and structural alterations on a large scale, and he built the road stations on the London and Birmingham Railway. In his younger days he was very intimate with Donaldson, who may be called the Father of the Institute, with T. H. Wyatt, who acted under him during the building of the Docks, and he reckoned amongst his friends Sir Charles Barry and Professor Cockerell. All these, and especially the two former, took great interest in

OUR PRESIDENT AS A BOY.

Thus he was bred in an architectural atmosphere. His regular education began at the Merchant Taylors' School, where he remained until his sixteenth year, when he was articled to his father, and during his pupilage attended the science and art classes at Somerset House, where the late Mr. Herbert, R.A., was then master. In 1847 he became a student of the Royal Academy, and after the completion of his articles took the degree of B.A. at the University of London, in 1851, whilst continuing his architectural training in his father's office. In January, 1853, he travelled through France, and thence to Genoa, Leghorn, and Pisa, and arrived in Rome just before the Holy Week, visiting with keen interest the most important buildings. From Rome he travelled

BY LAND TO NAPLES,

and thence to Amalfi, Salerno, and Paestum. Returning to Rome, he made valuable friendships with the artists assembled there in that year, 1853—viz., G. H. Mason, the idyllic painter, by whom he was introduced to two future presidents of the Royal Academy, Leighton and Sir Edward Poynter; and he also met Waterhouse and W. Burges. Leaving Rome after the Holy Week of 1854, he travelled in company with Burges to Arezzo, Perugia, and Assisi, where they stayed some weeks, making notes and sketches of the important fresco decorations of Cimabue and Giotto in the church of San Francisco. Thence they went to Florence, where they stayed several months, making notes and taking sketches and measurements of some of the palaces and other monuments; then continued their studies at Siena, Pisa, Lucca, and Pistoja. As the cholera was raging they could not then visit any places further north in Italy, but proceeded *via* Leghorn to Marseilles, and visited Lyons, Beaune, Dijon, and Troyes together, where they sketched and measured ruins. The two friends then separated, and Aitchison met his parents at Paris, and with

them returned to Italy, visiting Milan, Venice, Padua, Ravenna, Faenza, Bologna, Ferrara, and Verona, and then, by way of Switzerland, Strasburg, and Paris, returned to London in the summer of 1855. He then became his father's head clerk, and was taken into partnership with him in 1859. During this partnership he saw a great deal of

WORK OF AN ENGINEERING CHARACTER

on the Chester and Holyhead Railway. In June, 1861, his father died, and he began practice on his own account, becoming architect to the St. Katharine's Dock Company, after the amalgamation of the St. Katharine's with the London and Victoria Dock Company. He was engaged chiefly on large massive works—wharves, warehouses, and suites of offices—but was enabled occasionally to introduce architecturally designed fronts and staircases. The tobacco warehouse and offices and other warehouses for the Victoria Docks had a frontage of 500ft., by 170ft. in depth, costing £65,000. Messrs. Hubbuck's warehouse on the Thames has some architectural character. Having thus laid the sound foundation of constructive execution, as indicated above, we find him, in 1865, emerging into genuine and finished Architecture by the building of Lord Leighton's house, to which the glasshouse, the Arab hall, and picture gallery were subsequently added; and he also designed the ornamental furniture of the house, thus making it a complete work, not less admirable for

ITS ARCHITECTURAL FORM AND FITNESS

than for its masterly decoration, as an example of what may be done in permanent colour. The decoration is not of an evanescent character, being mainly of marble, mosaic, and tiles, the ancient tiles being Saracenic. The same is the character of other works by our president, as, for instance, Berkeley Square; No. 1, South Audley Street; 9, Chesterfield Gardens; 52, Prince's Gate; and 1, Grosvenor Avenue, where the structural wood is carved or inlaid with ivory, mother of pearl, and lapis lazuli. In 1869, through a chance recommendation given by Leighton, he altered and decorated the hall and staircase at 44, Belgrave Square for the Hon. Percy Wyndham, for which paintings in combination were made by Leighton; and this led to his being employed in much decorative work—viz., for her Royal Highness the Princess Louise at Kensington Palace, for the Duke of Montrose, Lord Leconfield, Sir W. Lawson, Sir S. Waterlow, Mr. Eustace Smith, M.P., Mr. John Aird, M.P., Mr. J. H. Renton, and a great many others. In 1868 he built the new Board room for the Thames Conservancy, designing also the furniture, whilst Leighton modelled the frieze of the Board room. In 1871 he altered and enlarged the house of Mr. F. Leyman, M.P., 15, Berkeley Square, and designed the furniture. In 1884, a house for Mr. J. Stewart Hodgson, which had been left unfinished by the death of his friend F. P. Cockerell, was put into his hands to complete. This implied the design of the whole of the

INTERIOR WORK AND DECORATIONS.

For the same owner he also made large additions to his house at Lythe Hill, designed the fittings, and decorated the rooms with colour and bronze. In 1877-78 he rebuilt Founders' Hall, and in 1886 the Royal Exchange Assurance Offices in Pall Mall, and in 1892 decorated in colour the Livery Hall of the Goldsmiths' Company. The works above enumerated are only a small part of the list that could be mentioned. He designed the decorations for the British Art Section at the Paris Exhibition of 1878, and was elected one of the officers of Public Instruction in Paris. He has been elected a member of the Société Centrale of the French architects, and also of that of Belgium, is a foreign Associate of the Royal Academy of Belgium, and has received numerous medals from our own colonial associations in recognition of his claims as an architect. In 1881 he was elected Associate of the Royal Academy, and in that position gave occasional lectures, but, after being chosen Professor of Architecture in 1887,

he has given his lectures annually. To his architectural he has added much good literary work, besides the lectures already referred to. He wrote the "Science and Art Syllabus" on the Principles of Ornament. He edited Ward's "Principles of Ornament" in 1892, and four years later added an Appendix on the Orders. In fact, he not only edited but practically rewrote the whole work. He is a contributor to the "National Biographical Dictionary," and one of the Examiners in the Science and Art Department at South Kensington. Although the claim for nomination to the Royal Gold Medal is not in the least confined to members of this Institute, and has been so considered by the Council on various occasions, it is nevertheless a source of great satisfaction to find one so worthy to receive it amongst our own body, and one who has so continually assisted our pursuits. Elected thirty-six years ago, our Gold Medallist of this year has assisted frequently in the Council, was Vice-President for four years reckoning from 1889, has contributed various Papers of great interest, has been an Examiner in the Voluntary Examinations, and has worthily maintained since 1896 the

HONOURABLE BUT NOT UNONEROUS

post of President. I wish to conclude with a few remarks on the Royal Academy Professorial lectures before closing this short summary of our President's claims to this distinction. No one can have read these valuable lectures, without feeling that they are calculated to encourage the architectural students who heard them, as well as those who have followed them as readers, to keep before their eyes a high ideal of Architecture as an Art, based on sound construction, technical knowledge, and true principles of design as its essential aim; and that whilst archaeological considerations are not to be ignored, they should never be allowed to dictate or force the hand of the architect into lines inconsistent with the former more important principles, and that it is only on such lines that architecture can flourish as a living Art. I am not aware that anyone has urged these views, which appear to me to be perfectly sound, so persistently and so well as our president, whom, with, I am sure, your approval, I shall now proceed to invest with Her Majesty's gracious gift.—Mr. Aitchison acknowledged the honour in a speech which we shall publish in our next issue, remarking that he considered there had been conferred on him, as an architect, the greatest honour England could bestow.

THE newly-elected Hackney Vestry has rejected the proposal to hand over the electric lighting order for the district to a limited company. There is now only one Moderate on the electric lighting committee, and it is anticipated that this committee will shortly bring up a scheme for electric lighting under the direct control of the ratepayers.

THE new brooms brought into existence by the Local Government Act are, it must be admitted, beginning to operate with praiseworthy energy in sanitary matters. The chief difficulty they have to surmount is that which has just presented itself to the Carnarvon District Council. Within the extensive area under its supervision there are numbers of cottages pronounced by its medical officer to be "wholly unfit for human habitation." Almost every village contains some specimens, and the result is that the health of the whole district suffers. It would be easy, of course, to apply a rough and ready remedy by destroying all such dwellings; the Council could do so at once. But houses are very scarce in the locality, and the dispossessed tenants would, therefore, either crowd into cottages already fully occupied or have to migrate, thus losing their employment. It has been decided, therefore, to allow them to continue in occupation pending the result of applying coercion to the landlords to execute the required sanitary repairs. But that will necessarily take a considerable time, and, in the meanwhile, these unfortunate villagers will have to accept the risk of living in houses "unfit for habitation."

THE LIFE-WORK OF WILLIAM MORRIS.*

By F. S. ELLIS.

THOUGH but six years have gone by, it seems but yesterday since I made one of a large audience which listened with earnest attention and eager interest to an address, on the subject of "The Woodcuts of Gothic Books," by the great man concerning whose wonderful artistic and literary career I have undertaken to speak according to the best of my ability. But I believe I am justified in calling his career not only wonderful, but also in applying to it the often misused term unique, for casting back one's eye over the glorious roll of English poets, which among them, I would ask you, besides William Morris has been so gifted, as not only to enrich the world with

A FULL TIDE OF SONG,

but also to make the age in which he lived an epoch in decorative art? Little did I suppose, as I listened to his well chosen words on the occasion I have mentioned, that it would ever fall to my lot to speak of him as belonging to the past, for he was four years my junior, and, until his last illness attacked him, seemed always possessed of so much life, vigour, and activity as might be expected to carry him to extreme old age. Alas! that it is otherwise, for his value in the world was far greater than that of a whole heap of other men, including myself. No one who has eyes to see, intelligence to understand, and wit to judge, can doubt that in the loss of William Morris we have reason to mourn

A GENIUS OF SUCH MAGNITUDE

as towered aloft even among the men of marked ability, brilliant faculties, and great attainments, who were contemporary with him, like a landmark in a wide plain. His death has left a blank that none of us can reasonably hope to see filled in our time. But though he was my junior in the mere reckoning of years, from the first day that I made his acquaintance I recognised clearly in how great a degree he was my senior in intellectual capacity and acquired knowledge. For more than thirty years I was accustomed to regard him as a teacher and a master, and you must, therefore, not expect from me anything by way of

CRITICISM ON HIS LIFE-WORK

other than hearty appreciation, admiration, love, and wonder. Yet it must not be supposed that he was one of those who desire to exact from their associates entire agreement on all subjects, or who thrust their views and opinions, whether upon Art or other matters, dogmatically upon their neighbours: he was, on the contrary, always most willing to listen to objections, to explain, and to consider a question from various points of view, unless he found his interlocutor to degenerate into ignorant nonsense or self-conceit, when he would close the discussion quickly enough. In thinking over his marvellous personality, I should not, though his versatility was wonderful, be inclined to describe him as a versatile man, for that term is usually applied to one who can do a great many things fairly well, but for the most part imperfectly. That was not the case with William Morris. Many things he assuredly could do, but he never rested till he was fully master of that which he undertook, and could do it thoroughly well—I will not say perfectly, for he would himself have counted the word "perfection" inadmissible in Art; as Ruskin has admirably and forcibly pointed out, "perfection usually means a loss of strength and degeneration into littleness," and a phrase that was constantly on Morris's lips was that, according to the French proverb,

"BETTER IS THE ENEMY OF GOOD."

But he was a many-sided man; to work at whatever he set his hand to till he was so entirely master of the subject that he was able

in instruct others; to know the history, the secrets, and why and wherefore of everything he engaged in, was his great characteristic. Yet those who knew him best will bear me out when I say that never was any man more entirely free from petty conceit and self-consequence. Though fully conscious of his own power and inherent ability; though, I believe, gratified to feel assured that he was looked up to by his fellows as a man of genius; he was, nevertheless, one of the most simple-minded, yea, one of the

MOST HUMBLE-MINDED, AMONG MEN.

His consciousness of power and knowledge in such things as he gave his mind to, raised him above the pettiness of conceit; while his clear conception of the limitations of his own, and of all human knowledge, engendered in him that humility which is a special note of truly great minds. It was my good fortune to make the acquaintance of William Morris as long ago as 1864, when "Jason" was as yet unpublished, and he was unknown in literature and Art beyond a narrow circle of friends. One of his grand qualities was faithfulness. I believe I may say with confidence that throughout his whole career he never lost a friend, except by the hand of death. The friends of his youth were the friends of his maturity; alas! that it cannot be said of his old age, for he was but sixty-two when he died, and no one ever thought of

MORRIS AS AN OLD MAN.

Even when the stroke of sickness fell upon him, and until within a few weeks of his death, his mind was as fresh and vigorous, his touch as certain, his fecundity of invention as wonderful, and his imagination not only as brilliant as in youth, but infinitely more so, growing brighter, richer, and more varied and powerful as the years rolled on, and until the end was reached. It is needless for me to recite any particulars concerning the biography of William Morris. They have been given, pretty much as I could relate them, in many of the magazines and newspapers during the last eighteen months, and in Mr. Aymer Vallance's important and excellent work, entitled, "The Art of William Morris." For a full and exhaustive biography, we may look forward to the book promised by Mr. Mackail in the course of next year, with confident anticipation that it will be well worthy its subject. Suffice it to say, that William Morris was born on the 24th of March, 1834, the eldest son of a man engaged in financial business in the City of London, who, by the accident of a fortunate investment, made a short time before he was cut off in the very prime of life, left his widow in such circumstances as enabled her to give all her children a handsome fortune as they came of age. This was certainly a circumstance as happy as it was remarkable, in that it opened possibilities to the future artist of carrying into effect

HIS VIEWS ON ART

at an early age, which might otherwise have been seriously retarded, or even never have had the opportunity of expansion and fulfilment. That the surroundings of the boy and youth were by no means calculated to awaken a love of Art will be readily understood and allowed by all who are conversant with what was in vogue in prosperous middle-class life during the first half of the present century. But it would seem that a love of the beautiful, and a sense of what was ugly, abhorrent, and vulgar was intuitive in William Morris's mind. I remember him speaking many a time of the Exhibition of 1851, at which all the world was struck with unbounded admiration, and telling how, as a youth of seventeen, he declined to see anything more wonderful in it than that it was "wonderfully ugly," and, sitting himself down on a seat, steadily refused to go over the building with the rest of his family.

AT MARLBOROUGH COLLEGE,

which he always spoke of with the greatest dislike and repugnance, he would not join in the ordinary games or sports, but found delight in rambling over the country-side on holidays, exploring its archæology and enjoying the scenery. His walks about the Wiltshire downs

he used to talk of enthusiastically to the end of his days. I have also heard him describe how, in the shorter intervals of leisure, he would employ himself in making nets, a token of the spirit of the handicraftsman which afterwards found such ample and glorious development. His abhorrence of Marlborough arose largely from the recollection that his teachers there taught him nothing whatever, so that one of the aptest scholars that ever lived had to be put under a coach before he was equal to matriculating at Oxford. It is needless to make more than a passing remark on a circumstance which had assuredly a most important effect upon his life-work. I refer to the extraordinary fact of his life-long friend, Sir Edward Burne-Jones, matriculating on the same day, and shortly afterwards forming his acquaintance. Nor is it necessary to enquire into the causes that led both these students to

RENOUNCE THE CLERICAL CAREER

that had been marked out for them. An inspiration fell on these youths, each of them coming from family and surroundings as little likely to prompt them to Art or poetry as were those of Chaucer, of Shakespeare, of Turner, or of Ruskin, but the wind bloweth where it listeth. The influence of Ruskin with the promoters of the Oxford Union caused Dante Gabriel Rossetti to obtain a commission at Oxford, and here was the flame at which the ready match of enthusiasm was kindled. The Oxford of forty or fifty years since was a place much more calculated to foster and encourage

THE SPIRIT OF MEDIEVALISM,

which was an integral part of Morris's nature, than it is under its present aspect. The whole spot wore a much more venerable and antiquarian air than it does at the present time. In his later years, Morris would earnestly deplore the ruthless spirit of change which had robbed Oxford of the charm it once had for him, and it was with difficulty he could be persuaded to go thither, even though his residence at Kelmscott brought him so close upon its borders. He used to speak with enthusiasm of the delight he experienced as an undergraduate in turning over some of the magnificent manuscripts preserved in the Bodleian, especially the "Romance of Alexander," and a thirteenth century "Apocalypse." I think it may fairly be said that the lifework of William Morris, as given to the world, began

IN HIS STUDENT DAYS

with the founding of the Oxford and Cambridge Magazine. From the way he mentions this publication, I infer that Mr. Vallance was unaware that Morris bore the sole cost of its production. Under such circumstances it is remarkable that it should have lasted through a year. I should think its doing so was due only to Morris's hatred of anything incomplete. The twelve months rounded it off, so to speak. Mr. Vallance mentions, as though it were a fact, that Morris kept a copy of this book under lock and key by reason of the great store he set upon it, a statement that must be due to some misunderstanding, for he certainly set no store whatever by the volume, and kept nothing under lock and key, even his watch key was usually astray. The same writer discusses the question of reprinting such articles as Morris wrote for the magazine. Of that I can only say that I should regard it as a ghoulis proceeding, and a

DISHONOUR TO THE AUTHOR'S MEMORY,

who again and again forbade their reproduction. I am happy in thinking that there are yet some years before anyone dare reprint these articles without permission, and before that time arrives I shall, in all likelihood, be beyond the knowledge of such matters. Having emancipated himself from the prospect of a clerical career, what could be more natural than that he should look to the practice of Architecture as a profession, and with that idea article himself to the man who was in those days looked upon as an oracle in that branch of art? But a year's experience in Mr. Street's office, and the clearer perception of what Architecture should be, more especially that

*A paper read before the Applied Art Section of the Society of Arts in May last.

Gothic Architecture, to the love of which his soul was wedded, caused him to see the impossibility, under present conditions, of attaining to and

CARRYING OUT HIS IDEAS,

and he therefore sacrificed the remaining term of his articles, and turned his attention to other matters. That he might with success have followed the profession of a painter is demonstrated by the excellent portrait of his wife painted before his marriage in 1859, which has come to light during the past year, after being for a long period supposed to be lost altogether. But I believe he felt that as a painter he would be overshadowed by the surpassing genius of his most intimate friend: his own saying was that he could not make his figures move. That he did not persevere in his studies in that direction was assuredly a great gain to the world at large, for, whatever distinction he might have gained as a painter and a poet, it is obviously impossible that he could in that case have achieved the great work as a handicraftsman and designer for which all those who have any eye for beauty are so largely in his debt. The year 1858 is marked as an important one in his life by the publication of

HIS FIRST VOLUME OF POEMS.

It is no wonder, seeing how entirely original was the note struck by Morris, that the book was not very heartily received by the public. It would have been a marvel had it been otherwise. It was offered to several publishers, and among others to Mr. J. W. Parker, proprietor of Fraser's Magazine, a person considerably esteemed in those days, as I well remember, for a man of taste and a fine critic. He declined to publish the volume, and after it appeared, had—as appears from a letter which has lately come to light—no better idea of the value of the verse than that “nineteen-twentieths of it was the most obscure, watery, mystical, affected stuff possible.” The genuine and earnest mediævalism of the author was altogether lost on Mr. Parker. That the volume was not an immediate success is not, as I have said, to be wondered at, for no book that is out of harmony with the spirit of the age can be expected to succeed until interest in the movement of it is awakened. Two young men, who in their maturity are still among us (Dr. Garnett and Mr. Joseph Knight), raised their voices, through the press,

IN APPRECIATION OF THE NEW SINGER;

but that the volume had not a very rapid sale was evidenced by the fact that some seven years later I bought from Messrs. Bell and Daldy the copies that then remained unsold, amounting, if I remember rightly, to some thirty or forty. But that the “Defence of Guinevere” met with no greater appreciation on its first appearance is, I think, easily accounted for, for unless the reader has some knowledge of the “Romance of King Arthur,” and the “Chronicles of Froissart,” and, indeed, of the mediæval spirit generally, it must be mere affectation to pretend to understand and enjoy the poems in Morris's first publication; as well might an Oriental, who had never heard of London, affect to enjoy the humours of “Pickwick.” A good deal has been said about printing other poems written about the same date, which the author preferred to leave unpublished. I am happy in knowing that the one person whose authority would be needed for the publication of them has decided against it, and will, I trust, make such provision as shall prevent them being put into print at any future period. He was too capable a critic of his own work for there to be any justification for publishing that which he desired

TO CONSIGN TO OBLIVION.

Architecture and painting abandoned as the occupations of his life, Morris's practical mind addressed itself to the task of showing that it was possible, while perforce shutting one's eyes to the exterior hideousness of ordinary houses, to do something towards making the interior more tasteful and beautiful than they had been for many a long year—reversing, in fact, the old saying concerning the cup and the platter. The house designed for him by

his lifelong friend, Mr. Philip Webb, was, perhaps, if we except some attempts in the pseudo-Gothic style, the first in the England of the nineteenth century to be arranged and decorated in a departure from the

HIDEOUSNESS OF DEAL DOORS

painted and grained to look like oak or maple, staircases covered with mustard-coloured paper, and squared in blocks to imitate some sort of marble that never existed, hangings usually of a dull heavy rep, and, in the wealthier houses, stuffs equally ugly, if more costly, varied in summer by preposterous sham lace, black horsehair chairs, ponderous yellow mahogany sideboards, and flock wall-papers. Those who are old enough to remember what it was all like, will, I think, bear me out, when I say that though our dwellings of to-day may not all of them be models of good taste, they are certainly better than they were in what we may call the age of anti-macassars and Berlin woolwork. It was at this time that Morris set himself to understand the method of ancient needlework and embroidery. To make himself completely master of how it was done, he obtained some pieces of ancient work, carefully took them to pieces, thread by thread, and thus made himself completely master of the mode of construction, and then fell to

DESIGNING PATTERNS AND FIGURES,

and worked the first piece with his own hands. The result was a series of noble needlework figures, for panels in the Upton House. I well remember with what surprise and delight it was that I first beheld these pieces of handicraft at Queen Square, and what a revelation on the possibilities of modern needlework it was to me. It seemed to carry one back to another world. The series, as originally designed, was never completed; four of the panels are now, I believe, in the possession of the Earl of Carlisle, and four or five others are preserved elsewhere. It speaks volumes for the vigour and hopefulness of the man that he ventured to set forth, so to speak single-handed, on the task of awakening people to a sense of hideousness that surrounded them, and the possibility of something more artistic and beautiful; for although he associated himself with other men of genius and ability, from whom he received most valuable aid and support, it was, in truth,

THE REMNANT OF HIS FORTUNE

that furnished the means of beginning the work which he and his friends undertook. How he threw himself earnestly into the project is witnessed by the fact that he left his pleasant house at Upton, and came to live in the smoke of central London, that he might give himself wholly to it. It is needless for me to go into the history of the establishment of the firm of Morris, Marshall, Faulkner and Co., which in outline is an oft-told tale, and which will doubtless be given at full in the forthcoming biography. As he has told us himself, in his lecture, entitled, “Making the best of it,” delivered before the Trades Guild of Learning, at Birmingham, in 1880, it was useless to suppose that any quick and sudden change could be made for the bettering of the

OUTWARD FORMS OF THE HOUSES,

which most of us, by no choice of our own, are compelled to inhabit, and the only thing to do, therefore, was to provide the means of making the interior surroundings more or less beautiful, by wholesome and pleasing decoration of the walls to begin with, and then by designing tasteful stuffs for curtains and hangings, and furniture less cumbersome and unsightly, both in form and material, than was commonly procurable at that period. Both wall-papers and textile fabrics were at first very simple, but not the less admirable therefore; but of later years they grew, in many instances, to be more rich and costly according to the demand that arose for them. How thoroughly Morris understood his aims and his work is manifest in every line of his invaluable lectures, entitled,

“HOPES AND FEARS FOR ART.”

delivered at Birmingham, London, and Nottingham, between 1878 and 1881. What can be more to the purpose than these words on

wall decoration? “Every line must have a distinct idea in it; some beautiful piece of nature must have pressed itself on our notice so forcibly that we are quite full of it, and can, by submitting ourselves to the rules of Art, express our pleasure to others, and give them some of the keen delight that we ourselves have felt. If we cannot do this in some measure, our paper design will not be worth much; it will be but a makeshift expedient for covering a wall with something or other, and if we really care about Art we shall not put up with something or other, but shall choose honest whitewash instead, on which sun and shadow play so pleasantly, if only our room be well planned and well shaped, and look kindly on us.” How completely do these words reveal to us the

REAL SECRET OF MORRIS'S SUCCESS

as a designer, namely, the perfect grasp that he had of his subject, and the spirit of love and enjoyment with which he bent to his work, so that it was a real pleasure to him, destitute of toil and pain. Morris's designs for wall-papers amounted to fifty entirely distinct patterns, which are worked in no less than 237 different colourings, every one of them arranged and directed by himself with that marvellous and unerring instinct for harmony of colour, which was one of his most wonderful gifts, and one of his most remarkable characteristics. So great is the difference made by the interchange of colours that the same pattern, to any but an expert and practised eye, would appear to be altogether distinct. This is no mere opinion of my own, but a fact that is proved by every-day experience. Then he produced forty-two

DESIGNS FOR PRINTED COTTONS

in 159 variations of colour, 39 designs for woven materials set out in 164 colourings, and a very large number of elaborate patterns for carpets and rugs of different textures, sizes, and varying methods of manufacture. In the Birmingham lecture, from which I have already quoted, the author is at the pains to give most valuable hints for the arrangement and decoration of a house, which are well worth the study of all who desire to make the interior decent, whatever the exterior may be, for which, in truth, usually the occupant is only accountable. One part of the exterior he does make useful suggestions for, namely, the setting out of the garden, wherein assuredly as much taste may be shown as in the decoration of the house, and it is moreover much more easy of execution and less costly, for once set going in the right way, it will in a great measure care for itself, and richly repay the attention bestowed upon it. I do not hesitate to say that but for the life work of William Morris, the

AMELIORATION OF COMMONPLACE UGLINESS,

which may be traced in thousands of houses, would never have come about, but things must inevitably have gone from bad to worse. No doubt a large part of the world persists, and will persist, in preferring ugliness to beauty—so much the worse for it. Sir W. B. Richmond, in his eloquent address to the students of the Royal Academy, has well said: “The fine arts are a necessity to a small public; the handicraftsman is a necessity to all: both are desirable, one is essential.” I think one might gloss this saying by the remark that the handicraftsman of taste and judgment ought to be especially considered necessary to the possessor of works of pictorial fine-art, for what I would ask you is more discordant or distressing to the eye, I might say, indeed, what is more ludicrous than to behold grand pictures hung in a room or gallery hideous in colour, amid

OSTENTATIOUS BUT TASTELESS SURROUNDINGS?

If there was one part of his Art work that Morris looked back upon with less satisfaction than another in his later years, I believe it was the earnest effort he made to revive the once glorious art of glass painting. It is a subject so great, and so difficult that it might have occupied the whole attention of even his genius and yet have remained unmastered. I have often talked with him about it. It may not be a lost art, but it is most certainly a dead art, we have its corpse but not its spirit. That is as dead as are the men themselves

who carried it to perfection. As well might we attempt to speak the language of those men. It is gone, never to return. Phonologists can tell us what sort of sound a thirteenth century Englishman made when he spoke, and we have before us the very words he would use, but if the most accomplished phonologist tried to imitate the pronunciation of our ancestors, I believe that nothing better than

UNINTELLIGIBLE GIBBERISH

would be the result, and so it is, that though we may arrive at all the methods of the twelfth and thirteenth century glass painters, no nineteenth century man can infuse into it the spirit which gave to it the inexpressible beauty which such glass as the great east window of Wells Cathedral is endued with. Of later years, Morris declined to be any longer a party to the practice of putting new wine into old bottles, or in other words, new glass into old Gothic traceries, which certainly savours strongly of the worst form of restoration. He had the advantage over all other practitioners in the art of working from the designs of artists of genius, which in itself gives his work a special value, while his fine appreciation of colour caused him to effect a reform in that direction which before his day was greatly needed; but I believe he was painfully aware of the monstrous incongruity of a

DOZEN OR MORE STYLES OF GLASS

being put into one building. The absurdity is hardly less, and the irritation to the spectator would be scarcely greater, if a dozen different architects were commissioned to design the body of a church, employing styles varying from the Byzantine of the seventh century to the Renaissance of Inigo Jones, in its various parts and divisions, the whole being mere imitative work—a Norman choir, a Byzantine nave, south transept early English, north transept Renaissance, and so on. Yet that is what is commonly done with stained glass. What think you would have been the effect of the Kelmscott Press Chaucer had it been illustrated by a dozen different artists, in as many different styles?

(To be continued.)

MESSRS. CHRISTIE, MANSON, AND WOODS have just concluded the five days' sale of the extensive collection of Chinese and Japanese porcelain, carvings in jade, rock crystal, and ivory, and other Oriental objects of art formed by the late Sir Rutherford Alcock, during his many years' residence in China and Japan. The collection included the following:—Chinese carvings in jade.—A pair of boxes and covers, of pale-green jade, formed as figures of quails, 40 guineas; a dark-green vase, shaped as a conventional carp, 6½ in. high, £38; a large dark-green cylindrical vase, with rocks, plants, and dragons, boldly carved and pierced, £22; and a large flat-shaped bowl, dark-green, on four small feet, carved with a cloud ornament, 115 guineas; a pear-shaped vase, with open lip, of splashed *sang de bœuf* and duff, 17 in. high, 50 guineas. Chinese enamelled porcelain.—A large globular vase, brilliantly enamelled with peonies, chrysanthemums, and other flowers, rocks, quails, and insects, circa 1740, 21 in. high, 100 guineas; a *famille rose* vase, decorated round the body with six characters, variously ornamented in prunus, fir, and bamboo, 14 in. high, 40 guineas; and a square-shaped vase and cover, and a pair of quatrefoil-shaped vases, *en suite*, finely enamelled with sunk circular panels of the twelve spirits of the flowers, the centre vase 13 in. high, the others 10½ in. high, 260 guineas. Chinese cloisonné enamel.—A pair of square-shaped vases, with circular necks and feet, decorated with panels of rocky lake scenes, &c., 15½ in. high, presented by Prince Kung to Sir Rutherford Alcock, £82; a circular, flat-shaped pilgrim bottle, decorated on either side with sprays of peonies, lotos, also birds and rocks in colours, 21½ in. high, 48 guineas; a rare flat-shaped, *sang-de-bœuf* bowl, on three monster feet, raised ridges round the border, with bosses, 14½ in., 97 guineas; and a *famille verte* deep dish, enamelled in the centre with the five-clawed dragon grasping the sacred jewel, 9 in. diameter, 51 guineas.

Professional Items.

ABERDEEN.—The Plans Committee of the Town Council has sanctioned the following plans of new buildings:—Two dwelling-houses on the west side of Walker Road, at its junction with Grampian Place; additions to offices at Provost Blaikie's Quay; shed on the east side of the South Esplanade, for Mr. Alexander Winchester, builder; three dwelling-houses on the north side of Church Street, Woodside; four dwelling-houses on the west side of Walker Road, for Mr. John McGregor, builder, per Mr. William Beattie, architect; addition to dwelling-house on the south side of Great Northern Road, for Mr. Alexander Catto, builder; additions and alterations in connection with dwelling-houses on the west side of Forest Road, per Messrs. Brown and Watt, architects; two dwelling-houses on the north side of Fonthill Road, per Messrs. Harper and Sutherland, architects; alterations in connection with the Lorne Hotel, Trinity Street, per Mr. William Ruxton, architect; dwelling-house and net store on the south side of Wood Street, (Torry), per Mr. Alexander Wallace, builder; two dwelling-houses on the south side of Sunnybank Place, for Mr. Joseph Shirras, builder; offices and stores on the north side of Balmoral Terrace, per Mr. John Cameron, builder; four dwelling-houses on east side of Holburn Street.

ATTERCLIFFE.—A new school-chapel in Stanforth Road has just been opened. The school-chapel, which will accommodate 220 persons, has been erected to a neat design, and sufficient land adjoining has been acquired to permit of a properly equipped chapel being built at some future date. Mr. William Aspland, Handsworth, was the contractor, the architects being Messrs. James and John Hardcastle, Woodhouse.

BEESTON.—A new Roman Catholic Church, dedicated to St. Peter, at Beeston has been opened. The building is from the designs of Messrs. Hart, of Corby. The structure is of red brick, with stone dressings, and is in the Early English style of Architecture. The contractors were Messrs. Turner, of Beeston.

BRIDLINGTON.—The foundation stone of the new Bridlington Grammar School was laid a few days ago. The style of Architecture is the scholastic type of the English Renaissance. The structure will be of red brick, with stone dressings and red tiled roofs. The hall very properly occupies the centre. This is 51 ft. 6 in. long by 30 ft. wide, rising through the height of the two stories. It has an opened timbered roof, and is surmounted by a turret. On the west and south sides of the hall are four class rooms, which will afford accommodation for a hundred boys. On the north side space is left for additional rooms, which will be provided when funds permit. The buildings have been designed by Messrs. Botterill, Son, and Bilson, architects, of Hull, and the erection will be carried out by Messrs. John Thompson and Co., of Peterboro', at a cost of over £8500. Mr. W. H. Williams is the clerk of works.

BURNHAM OVERY.—The Church of St. Clement could not fail to attract the attention of even the ordinary traveller, owing to its unique construction, having the tower (one-belled) between the nave and the chancel. In consequence of a considerable amount of dilapidation it was deemed necessary to close it about eight months ago, and commence a work of renovation and restoration, which has been so far carried out by Mr. F. Norman, of Burnham Westgate, as contractor, and Mr. Herbert Green, of Norwich, as architect. The re-opening of the edifice took place a few days ago.

ECCLESFIELD.—The opening of the new chapel which the Wesleyans of Ecclesfield have erected was recently performed. The chapel is cruciform in plan, having a gallery round three sides, and at the eastern end a large organ and choir gallery. At the west end is a spacious vestibule entered by large

folding doors, and giving access to inner lobbies, from which the chapel is entered, and to stone staircases leading to the gallery, which is also approached by two staircases at the western end. The style adopted is the Renaissance. The building is faced with Dunford Bridge stone, with cornices and other relief in dressed ashlar. In the centre of the main front is a large entrance doorway with carved stone arch, cornice, and balustrade. Above is a large mullioned window in three lights, and over this is a moulded arch enclosing a richly carved tympanum. On either side is a boldly projecting pilaster, relieved with carving, and finished with an enriched cornice and balustrade. The western staircases project from the main building with semi-circular ends, filled in with mullioned windows, and finished with an enriched cornice and balustrade. The nave and transepts are lighted by mullioned and arched two-light windows. Mr. H. W. Lockwood (Sheffield) was the architect, and Messrs. Mastin and Son (Sheffield) the builders.

GLASGOW.—The corner-stone of the new Episcopal church and halls which are in the course of erection in Baltic Street, Bridgeton, Glasgow, was laid recently. The new church is built in the late Gothic style of Architecture, and consists of a nave with a chancel and a south aisle. A mourning chapel adjoins the chancel, and a mortuary chapel for the use of all denominations in the district is at the south-west corner of the site. As to the halls, the large one will accommodate between 300 and 400 persons, and there is also a smaller one. The total cost of the structures is estimated at £4000.

HEREFORD.—Mr. Bond, the lecturer at the architectural classes held at the Free Library, Hereford, during the past season reports as follows: "There was again a large and regular attendance both at the lecture and at the class, and on the average twelve papers per week were worked for the lecturer. Owing to the fact that continuous work has been done by the Students' Association during the preceding autumn, the students were all prepared to receive the advanced instruction given in the recent course of lectures, and work of solid and permanent value has been done which, I feel sure, will be to very many of the students a source of life-long satisfaction and enjoyment. In many cases, too, the result of these two courses of lectures has been not merely the acquaintance of a considerable amount of technical knowledge, but very marked increase in thinking power and in literary style." The examiner's report was as follows:—"The papers throughout show considerable merit, and the best excellent work. In some there is a tendency to write on one side or a little outside of the question. In a few, on the other hand, there is rather too much stringiness, savouring of cram, but neither of these faults is very common. The drawing is fair, and occasionally good."

INVERNESS.—The beautiful and, in one respect, unique chapel which has been gifted to the Northern Infirmary at Inverness has been opened. The nave, which is 44 ft. in length by 18 ft. in width, is intended for all forms of Christian worship. On the north side of the nave an altar for the use of the priests of the Roman communion is placed in a transept, which is separated from the nave by a wrought-iron gate and crimson hangings, and the altar of the Anglican communion is similarly placed on the opposite side of the nave. The whole interior of the edifice is lavishly furnished, and a dedicatory inscription is chiselled over the doorway. The building is designed in late pointed Gothic, the architects being Messrs. Ross and Macbeth, Inverness. The total cost is over £3000.

KELSO.—At a meeting of Kelso Police Commissioners a formal resolution was adopted to the effect that the Commissioners acquire the Town Hall and site by feu charter, and repair, alter, and fit up the same as a public hall, court-room, and burgh offices, Messrs. Swanston

and Legge, architects, Kirkcaldy and Burntisland, having been entrusted to carry out the work.

MORECAMBE.—Designs have been submitted for an important addition to Morecambe's places of amusement. The scheme is for a massive tower of an entirely novel and ingenious design, somewhat resembling an Eastern temple. An eligible site has been secured in Calton lodge and grounds, which have an extensive frontage to the promenade between the Central Pier and Emmanuel Church. On a portion of this estate it is proposed to erect a tower 232ft. in height and 130ft. diameter at the base. The tower in general form will be a cone gradually diminishing in diameter, and having four floors above the ground level. The first of these floors will be 70ft. above the ground, the second 102ft., the third 132ft., and the fourth 157ft., with a turret reaching to a total height of 232ft. A road track, with an electric railway under it, will wind round outside of the eight principal pillars in spiral form. The structural steelwork of the tower is calculated to support a strain of 1000 tons on every portion accessible to the public, in addition to its own weight, and a wind stress of 56lb. to the square foot over its whole surface. The weight of the constructive steel work of the tower is estimated at about 862 tons. The design throughout is Oriental in character, and picturesque in appearance. The designer and patentee is Mr. Tom Bradley, architect and surveyor, Bingley. Messrs. W. H. and K. Sugden, of Keighley, are the architects of the structure.

PLYMOUTH.—The first portion, consisting of entrance and a room capable of holding some 200 people, which will eventually form a portion of the west end of the new church at Cattedown, is almost complete. A very handsome west entrance has been built from the designs of Messrs. Weblin and De Boinville, of Plymouth, and Mr. A. H. Trevenen has completed the sculpture of the scene on Calvary on the tympanum over the doorway. If the church when complete is worthy of the doorway, it will be an edifice which will take a high place among public buildings in Plymouth.

SOUTHWOLD.—The old bridge near the railway station is being superseded by a modern structure. The new bridge, the plans of which have been prepared by Mr. Henry Miller, County Surveyor, will have brick abutments and retaining walls, and the superstructure will be formed of steel trough girders from Messrs. Dorman, Long, and Co., of Middlesbrough. The parapets over the span will be of wrought iron lattice work. Brick piers will be erected at each end of the bridge, the Southwold end of which is to be lighted. The approaches will be fenced with cast iron standards and wrought iron rails. Mr. Miller, in having the bridge erected to the east of the present one, has effected a desirable improvement, as the present one is quite out of the line of the road.

WORMIT.—Plans have been prepared by Messrs. James MacLaren and Sons, architects, Dundee, for a new church at Wormit. The building is to be erected in the grounds of the present Free Church Mission Hall, and the hall will be used for congregational purposes. The new church will accommodate about 500 persons, and is to cost £2700, exclusive of the site.

YORK.—A new church is to be built at Bishopthorpe, near York, on an excellent site in the centre of the parish given by the Ecclesiastical Commissioners. Mr. Hodgson Fowler, of Durham, has prepared plans of a building which, when completed, will consist of nave and clerestory, south and north aisles, chancel and clerestory, south chapel, organ chamber, sacristy, and vestry. At the west end will be a tower of three stages rising to a height of 64ft. The general style of Architecture adopted is the late fourteenth century Gothic. The total cost of the building will be £6600, and accommodation will be provided for 320 worshippers. The builders are Messrs. Bowman and Sons, Stamford, and Mr. T. A. Bolton, of York, is clerk of the works.

Under Discussion.

MASTER BUILDERS' AND WORKMENS' COMPENSATION.

The Three Towns Master Builders' Association, at a recent meeting held at Devonport, was largely engaged in discussing the question of insurance against accident under the Workmen's Compensation Act. Various points arising requiring further information, it was decided to adjourn the subject for another meeting, to be called immediately on receipt of replies to inquiries and legal bearing of certain clauses in the forms of policy, and also the rates of other offices not directly under consideration, the members of the Association being fully alive to the great importance of being well secured under policy at the lowest possible rate of premium.

THE SOCIETY OF ENGINEERS.

An interesting visit was made by a party of the members of the Society of Engineers to the works of the Gas Light and Coke Company at Fulham and the gigantic wheel at the Earl's Court Exhibition. Among those present were Mr. W. Worby Beaumont, president; Mr. H. Adams, past president; Mr. J. Patten Barber, Mr. J. Bernays, Mr. G. Burt, Mr. D. B. Butler, Mr. Percy Griffith, Mr. R. St. George Moore, Mr. M. Wilson, members of council; and Mr. G. A. Pryce Cuxson, secretary.

NEWLY-ELECTED OFFICERS AND COUNCILS.

THE BRISTOL SOCIETY.—President, Mr. W. L. Bernard, F.R.I.B.A.; vice-presidents, Messrs. W. V. Gough and Joseph Wood; hon. sec. and treasurer, Mr. H. Dare Bryan; hon. librarian, Mr. R. C. James, A.R.I.B.A.; council, Messrs. F. Bligh Bond, F.R.I.B.A., W. S. Skinner, J. H. LaTrobe, F.R.I.B.A., G. H. Oatley, F. W. Wills, J. F. Wood, A.R.I.B.A.; auditors, Messrs. Thos. Nicholson and T. H. Weston, A.R.I.B.A.

THE DEVON AND EXETER SOCIETY.—President, Mr. James Crocker, F.R.I.B.A.; vice-president, Mr. Henry George Luff, A.R.I.B.A.; council, Messrs. Arnold Thorne, F.R.I.B.A., Charles King, George Soudon Bridgman, C. J. Tait, A.R.I.B.A., S. Dobell, James Jerman, F.R.I.B.A., B. Priestley Shires, A.R.I.B.A.; hon. treasurer, Mr. Octavius Ralling; hon. secretary, Mr. Harbottle Reed; ex-officio member of council, Mr. James Hine, F.R.I.B.A., past president.

THE LIVERPOOL SOCIETY.—President, Mr. W. E. Willink, A.R.I.B.A., M.A.; vice-presidents, Messrs. W. Owen, F.R.I.B.A., and J. Woolfall; joint secretaries, Professor F. M. Simpson and Arnold Thornely, A.R.I.B.A.; hon. treasurer, Mr. James Dod; hon. librarian, Mr. J. W. Blakey, A.R.I.B.A.; members of council, Messrs. C. J. Anderson, H. L. Backwith, J. W. Blakey, A.R.I.B.A., T. E. Eccles, A.R.I.B.A.; Henry Hartley, F.R.I.B.A.; William Owen, F.R.I.B.A.; J. Woolfall, F. E. Pearce Edwards, A.R.I.B.A., and E. P. Hinde, A.R.I.B.A.

THE YORK SOCIETY.—President, Mr. George Benson, A.R.I.B.A.; vice-presidents, Messrs. C. H. Channon and J. T. Pegge; hon. treasurer, Mr. William Hepper; hon. secretary, Mr. A. B. Burleigh; hon. librarian, Mr. S. G. Highmoor; committee, Messrs. J. Ferguson, A. Hirst, T. Monkman, A. J. Penty, and E. A. Pollard.

THE GLASGOW ASSOCIATION.

The annual business meeting of the Glasgow Architectural Association was held in the Rooms, 187, Pitt Street, on Tuesday, June 7, 1898, the president, Mr. W. T. Conner, A.R.I.B.A., in the chair. The secretary read the annual report, including the statements of the treasurer and librarian, which showed the association to be in a flourishing condition. During the session nineteen new members were admitted, making an increase in the roll over last year. The syllabus comprised nine members' papers and four lectures, over and above which there were four exhibitions of drawings and photographs. There have been three prizes offered for competition, of the

respective values of £10 10s., £5 5s., and £2 2s., the first being for a design and the other two for measured work and sketches. The treasurer's account shows a most satisfactory balance of £41 3s. 6d. on the credit side, and the librarian's statement enumerates valuable additions by purchase and donation. The following were elected to hold office during the coming session:—President, Mr. P. S. Hill, A.R.I.B.A.; vice-presidents, Messrs. John Fairweather, A.R.I.B.A., and C. E. Whitehead; hon. secretaries, Messrs. R. J. Walker and Alex. Wingate; hon. treasurer, Mr. W. P. Tucker; hon. librarian, Mr. Hugh Dale; general committee, Messrs. James Lochead, A.R.I.B.A., William Vickers, W. J. Blain, Thomas Ramsay.

ARCHAEOLOGICAL EXCURSION.

About twenty members and friends attended the first excursion of the season of the Birmingham Archaeological Society, which was to Shustoke and Nether Whitacre. At Shustoke the church was first visited. The next halt was made at Bott's Green House. This half-timbered mansion-house bears the crest of the Digby's very prominently, and has many features of external interest. In the interior a carved stone chimney-piece and a panelled room are the chief objects of note. Nether Whitacre Hall, which was next visited, also proclaimed itself by the very prominent fleur-de-lis a seat of the Digbys. The house has been much modernised, but the ancient moat remains practically intact, and is in the highest degree picturesque. There are remains of three towers covering the bridges, and in one case the remains are considerable. The old gateway opening upon the principal entrance is a very quaint half-timbered structure. The church of Nether Whitacre possesses an ancient tower, projecting from which are several most curious gargoyles. The interior possesses no object of any interest except the monument to the last direct heir of the famous Jennens property. The tablet records many benefactions, among which is one for the rebuilding of the church.

DISTRICT SURVEYOR'S ASSOCIATION DINNER.

The District Surveyors of London dined together at the Café Royal Restaurant on Tuesday, the 14th inst. The chair was taken by Mr. Horace Gundry, F.R.I.B.A., the president, and he was supported by the members of the Tribune of Appeal, Mr. Arthur Catis, Mr. A. A. Hudson, and Mr. J. W. Penfold, two members of the L.C.C., Mr. R. A. Robinson and Mr. H. A. Harben, while Parliament was represented by Sir George Fardell, M.P. Other visitors were Mr. J. Hobb, Mr. G. W. Thomas and Mr. J. W. Godfrey, who attended with their chief, Mr. Thomas Blashill, superintendent architect, and Mr. B. Hayward. The R.I.B.A. was represented by Mr. W. Emerson, hon. secretary, and the law by Mr. T. Wheeler, Q.C., and Mr. A. Collins, and Mr. J. Andrews was the guest of the vice-president. The following district surveyors were present:—Messrs. B. Tabern, V.P., H. H. Collins, C. F. Hayward, F. Waller, G. Elkington, A. W. Tanner, E. Marsland, W. H. Lees, R. P. Nottey, Alex. Payne, A. Conder, Walter Spiers, H. Chester, H. W. Stock, Henry Lovegrove, A. Williams, George McDowell, E. Calritt, and A. Crow. The usual toasts were honoured, and the musical arrangements were under the direction of Mr. G. F. Smith, of Brixton. The toast of "The Houses of Parliament" was proposed by the president, and responded to by Sir George Fardell, M.P.; "The London County Council" by Mr. C. Foster Hayward, responded to by Messrs. Harben and Robinson; "The District Surveyors' Association" by Mr. A. A. Hudson, responded to by Mr. H. Gundry, president; "The Tribunal of Appeal" by Mr. H. H. Collins, responded to by Mr. H. Catis; "The Officers of the County Council" by Mr. T. W. Wheeler, Q.C., responded to by Mr. T. Blashill; "The Vice-President and Officers" by Mr. G. Elkington, responded to by Mr. Tabern; "The Visitors" by Mr. H. Lovegrove responded to by Mr. W. Emerson.

Views and Reviews.

GUIDE TO KEW GARDENS.

In the illustrated guide, to the Royal Gardens at Kew, just issued by Messrs. Dawbarn and Ward, Limited, no attempt is made to lure one to the botanical beauties for which Kew is famous. The average visitor regards an afternoon in Kew Gardens in very much the same light as he would an afternoon in the Bois de Boulogne; he regales his pleasure-loving instincts to the full, but looks to botany, as a science, no more in the one instance than he would in the other. The average visitor to Kew wants a guide-book which will tell him about the most notable objects in the Royal Gardens without troubling too much about the scientific "steeps" of botany. The present work, edited by Mrs. S. Goldney, aims at filling this need. The interest as well as usefulness of the book are promoted by the series of excellent photographs of the many striking objects and delightful nooks with which the gardens abound. The authoress takes the reader by the hand, and entering the Victoria Gate, embarks on a thorough tour of the gardens, explaining her course and the beauty passed on either hand, and retelling the history of the buildings dotted throughout the domain. A short historical sketch of Kew completes Mrs. Goldney's guide.

Illustrated Guide to the Royal Gardens, Kew. Edited by Mrs. S. Goldney. 1s. London: Dawbarn and Ward, 6, Farringdon Avenue, E.C.

BELL'S CATHEDRAL SERIES.

It is pleasant to be able to congratulate the editors of Bell's Cathedral Series on the appearance of three more of their charming little volumes. Norwich, Peterborough, and Hereford, are the cathedrals selected, and they have ample justice done to them by Mr. C. H. B. Quennell, the Rev. W. D. Sweeting, and Mr. A. Hugh Fisher, respectively. The value of this series has been generally recognised by the Press, and there is little to be added to what has already been said. There is no doubt that these guide-books would prove most valuable to any architectural student visiting the cathedrals for the purpose of study. They seem to be compiled with great care and accuracy, with perhaps an occasional slip, such as where the tower of Hereford Cathedral is described as "Decorated," and the date of its erection given as 1200-1215. Judging from the illustrations, and speaking from personal memory, this tower is certainly not decorated, and its date more probably 1300-1315. The illustrations to these books are perfect; they consist of photographs, sketches, drawings, reproductions of old prints, and a general plan. The photographs—particularly the interiors—are of a very high class of work, and the sketches are mostly vigorous and simple, and serve to illustrate features which could not be so easily photographed. If the whole of this series is kept up to the present high level, the undertaking will reflect the greatest credit on all concerned. A. R. J.

Bell's Cathedral Series. Edited by Gleason White and Edward F. Strange. London: George Bell & Sons, 1898.

The Royal Commission are now prepared to circulate information respecting the Paris Exhibition of 1900. The classification and rules for exhibitors, together with forms of application for space, can be obtained by applying to the Secretary of the Royal Commission, Paris Exhibition 1900, St. Stephen's House, Westminster, S.W.

The inauguration of the Hull electric tramway scheme took place recently, when the first rails were formally laid. The cost of the work will be over a quarter of a million. Powers to borrow £270,000 for the trams and £100,000 for the pavement have been obtained. It is intended to place a double line of rails throughout the greater portion of the system, and there will be altogether about nine miles of double tracks, with about half a mile only of single lines where the width of the streets does not admit of the double ones.

Enquiry Department.

SLATES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Enclosed I beg to send you two samples of slates, the one marked with a + from the Whitland Abbey Green Slate Quarry and the other, marked M, from a quarry near the first. Would you kindly give me your opinion with regard to their durability, and also liability to breakage, compared with good North Wales slates? A reply in the next number of the Builders' Journal would oblige. —I am, yours, &c., R. W.

Both samples appear good, hard, compact slates, and would, we think, prove durable. The one marked with the cross would probably weather best, and be less liable to breakage than the other, and both compare favourably with average North Wales slate; but not being so fine grained as Festiniog or Bangor selected, they would not "hole" or "edge" or "plerry" so cleanly as these.

SCHOOL PLANNING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you please inform me the names and prices of any books on school planning (in accordance with the requirements of the Education Department), and oblige, Yours faithfully,

June 1, 1898.

"SCHOOL."

Mr. Robson's book, published in 1874, is the only work on schools likely to meet your requirements—indeed, the only important work with which we are familiar. It is now out of print and scarce, but Mr. B. T. Batsford, of 94, High Holborn, W.C., could supply you with a copy at 18s. 6d., post free. There is a work on "School Architecture" by Palliser, Palliser, and Co., of New York, but this would not assist you with regard to our Education Department. It contains hundreds of plans, elevations, details, &c. Mr. Batsford has a copy at 4s. 6d.

R.I.B.A. EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have before received kind information from you, and would like to ask your opinion re the following:—In the subject for "Design," in R.I.B.A. Final Testimonies of Study, I am thinking of taking up a school, say, "Higher Grade School." What accommodation would be required—rooms, &c. I understand the Board of Examiners attach great value to the testimonies sent up. My measured drawings are well on the way. The sheet on roof truss strains I cannot master. What text-book would you recommend? The sheet of constructive masonry, I suppose, may be re-drawn from some authority? Peter Nicholson's work. Thanking you in anticipation.—Faithfully yours, M. G. R.

P.S.—Having very little spare time, I fear I shall require assistance perhaps for three or six months before examination, having to sit June next. Do you think weekly correspondence for three months from a coach would be advantageous?

It is true that the Board of Examiners of the R.I.B.A. attach considerable importance to the "Testimonies of Study" in their final examination, and that poor composition or careless or imperfect execution will disqualify the applicant from admission to the examination itself; but the examination is meant as a test of all-round general knowledge, and not of special technical knowledge, and it is quite unnecessary to take such a special subject for design as a "higher grade school." The board desires a building of moderate dimensions, such as a villa, parsonage, local institute, cottage hospital (a simple cottage has been proved in fact sufficient); but, whatever the design is, it must be drawn out in proper working drawings, figured, with all particulars, and with the necessary details, as though prepared for the direction of the contractor. If you possess the working drawings of a design which has been actually carried out, they will serve your purpose excellently. It is not intended by the Board

of Examiners that the construction drawings should be copied. In the oral part of the examination the examinee is specially questioned upon the subject of his Testimonies of Study. As text-books on the subject of roof truss strains, B. N. Stoney's "Theory of Strains," Spore's "Handbook," and "Notes on Building Construction" (Rivington), may be recommended, with T. Timmins' "Examples of Iron Roofs," and for stone work Rivington's notes above mentioned, and E. Wall's treatise on Building and Ornamental Stones will be of service. The assistance of a coach (by correspondence or otherwise) would be of great assistance in directing the most advantageous course of study. You should get the R.I.B.A. Kalendar, wherein particulars of examination, with advice, list of text-books suggested by the board, and sample papers from previous examinations are set forth.

TENDERS.

ASHTON-UNDER-LYNE.—For alterations and extensions to the Railway Hotel, Guide Bridge. Mr. J. H. Burton, architect, 2, Guide-lane, Hooley Hill:—
James Ridyard ... £117 0 | Wellerman Bros. ... £110 10
Edwin Marshall ... 115 0 | * Accepted.

AUDENSHAW.—For flagging a portion of Denton-road, for the Audenshaw District Council. Mr. J. H. Burton, surveyor, 2, Guide-lane, Hooley Hill:—
Jas. Farrell ... £86 4 11 | Worthington and H. Kinder ... 61 12 2 | Powall ... £38 3 1
* Accepted.

[Surveyor's estimate, £63 16 2.]
AMBLE.—For New Mead Memorial School at Amble (Northumberland), for the National School Managers. Mr. J. Wight Douglas, architect, Alnwick. Quantities by architect:—
A. Douglas ... £2,018 0 | Carrs & Son, Amble, Acklington ... £1,936 3
* Accepted.

Several separate tenders for the various trades were also accepted.
BANGOR.—For erecting five houses in Farrer-road, Bangor, for Mr. W. Farrer Roberts. Mr. Richard Hall, architect, Bangor. Quantities by the architect:—
R. & J. Williams £4,745 0 0 | J. Hamilton and Watkin Jones £3,895 0 0
Robert Williams 3,940 4 4 | Jones & Williams 3,870 0 0
Evan Williams ... 3,805 16 9 | William Parry, Bangor ... 3,786 16 0
* Accepted subject to modification.

BASLOW (Derbyshire).—Accepted for the erection of a residence, for Mr. E. M. Wrench. Mr. E. Morewood Longdon, architect, Bakewell. Quantities by architect:—
T. Allsop and Son, Bakewell ... £1,450

BLYTH (Northumberland).—For the erection of business premises, York and Regents-streets, for the Central Industrial and Provident Co-operative Society, Limited. Mr. A. A. Windle, architect, 10, Waterloo-road, Blyth:—
D. Weightman ... £4,643 6 8 | J. Goulding and R. J. Harbottle ... 4,171 0 0 | Sons ... £3,368 0 0
H. Bower ... 3,868 2 1 | B. Baxter ... 3,296 0 0
W. How, jun. ... 3,568 0 0 | Barron & Temple, J. & W. Simpson 3,515 10 0 | Waterloo, Blyth ... 3,156 9 3
* Accepted.

BROADSTAIRS.—Accepted for building fourteen houses in Gladstone-road, Broadstairs, in two blocks of six and eight each. Mr. A. J. Sheffield, architect, 35, Eastcheap, E.C.:—
T. Hurley (at £350 each house) ... £4,900

CAERPHILLY.—For the erection of sixteen houses, Aber. for the Panteg Building Club. Messrs. Griffiths and Jones, architects, Tonypandy and Llandaff:—
J. Bowen ... £3,130 | J. P. Williams, Leng. D. Evans and Son ... 2,928 | henith, nr. Caerphilly *£2,761
G. H. Leonard ... 2,928 | J. Lewis ... 2,736
* Accepted.

CROYDON.—For erecting three shop premises, on the site of Nos. 104 and 106, High-street. Mr. A. Broad, architect, 23, George-street, Croydon. Quantities by the architect:—
S. Hart ... £3,700 | E. J. Saunders ... £4,000
J. Smith and Sons ... 3,679 | W. Smith and Son ... 3,487
F. W. Sedgwick ... 3,613 | A. Bullock ... 3,484
S. Page ... 3,588 | W. Pearson and Co. ... 3,360
E. P. Bulled and Co. ... 3,500 | D. W. Barker ... 3,323
* Accepted.

FIRECLAY BRICK WORKS. PARKSTONE, DORSET.

PUBLIC WORKS IN AUSTRALIA.

A VIGOROUSLY progressive policy of public works has been carried out in New South Wales of late years. The various works are carried out and maintained by the Public Works Department, which has a most efficient staff of engineers stationed in various parts of the country, who are controlled and directed from the administrative office in Sydney. The mileage of roads at present, directly or indirectly, under the charge of the Department, that is exclusive of the roads in towns under municipal control, is 38,951, of which 12,123 miles are simply bush tracks, and 26,758 miles are cleared, formed, or metalled roads. There are 2772 bridges in the colony, having a total length of nearly 50 miles, and 31,073 culverts or small bridges, with a total length of over 87 miles. The roads as main highways for traffic from Sydney have, to a great extent, been superseded by the railways, but for a large portion of the colony they are still the sole means of communication, and as feeders to the railway system they play a very important part. In the interior a vast amount of work has been done in providing branch roads to the main arteries; roads between townships, and for access to the railway system; and routes for stock purposes.

THE BLESSING OF TIMBER.

On many of these latter, in the dry parts of the far interior, a large sum has been expended in providing tanks and wells for supplying water to travelling stock, and during the past few years artesian bores have been put down for the same purpose in some of the driest regions with signal success. Owing to the nature of the soil, and the absence of suitable stone, the cost of road construction in not a few of the inland districts is exceedingly high, so much so that where there is any large amount of traffic it is found absolutely cheaper to construct light railways, which, in some instances, has been done, and will no doubt be continued on a much more extensive scale in future years. The bridges are constructed in a very substantial manner, timber being used wherever possible. The colony is fortunate in having an almost unlimited supply of hardwood eminently suitable for bridge work and structures of a like character. The ironbark which is mostly used for the purpose has a tensile strength of about one-third that of wrought-iron, while its durability may be gauged from the fact that some

BRIDGES FIFTY YEARS OLD

are still carrying traffic, while numbers of others, totally unprotected from the weather, have been built over thirty years. The operations of the Department include railway and tramway construction, improvement of harbours and rivers, bridges and road construction, repair and renewal, construction of public buildings, water conservation and irrigation, sewerage construction, &c. Among the larger undertakings of the Department is the Sydney sewerage system, which, in its present complete form, is of comparatively recent date, the works having been only commenced in 1880. Briefly described, the works consist of a main northern outfall sewer which collects the sewerage of the portion of Sydney and suburbs which naturally drains into Port Jackson, and discharges into the Pacific Ocean at a point about five miles to the south of Sydney Heads. The sewerage of the southern district is collected into a separate system, and conveyed to a sewerage farm on the shores of Botany Bay. The scheme also comprises a system for the western suburbs, which also discharges on to the sewerage farm at Botany. In addition to the extensive reticulation works in connection with the main scheme, numerous stormwater drains have been constructed where foul and insanitary creeks formerly existed. The amount expended on these works up to June 30, 1896, was £1,920,008, including a small expenditure on country sewerage. The effect which the construction of the sewers has had upon the health of Sydney has been most marked.

A Great Welsh Industry.

BY A SPECIAL CORRESPONDENT.

TOURISTS know all about the Vale of Llangollen—as a resort for a summer holiday. But it may be questioned whether many of them know that nearly at the foot of the Vale are to be found the biggest terracotta and tile works in the country. So it is. The other day when I arrived at the little station of Trevor, a mile or two from the better known Ruabon on the Great Western main line, it was not as a tourist, but as an inquirer that I had come. By special favour I was to be shown over the works of Mr. J. C. Edwards, and I was full of curiosity as to what was to be seen there. Led by Mr. Lloyd Edwards himself I was in no sort of danger of missing any feature of interest, and the very first item was a surprise. The first shed was not by any means like a tile works or works of any kind where anything softer than iron is to be dealt with. It was, in fact, neither more nor less than an engineer's shop, and I found that all the machinery is repaired and kept in order by the staff here at the works. And not only so, but much of it is actually made by the engineers on the staff. So that evidently the works are to a very great extent independent of the outside world for the rectification of the thousand and one little accidents that are always sure to happen where machinery of a complicated character is in use. The actual work of

TILE AND TERRA-COTTA MAKING

is, perhaps, the oldest industry on the face of the earth. And yet there are methods devised and substances introduced from time to time that are ever improving the manufacture and reducing the cost of production till the trade bids fair to be as essentially modern as any that is the outcome of nineteenth century life, and demanded by the growing luxuriousness of our civilisation. To take one example. I saw a tile with the unmistakable lustre of burnt copper upon it. This was produced for the fireplace of a realist who wanted an imitation of a very old Spanish process. Then, after asking Mr. Edwards what he thought of the old Romans as tile makers, and realising that they were most excellent workers in clay, it seemed a sudden shock to come out of the shed where we had been talking and imagining that we were in the ancient times, and to see, opposite to us, tiles for the new electric railway in London. But it was real, and very certainly so. Indeed, Mr. Edwards might have had the contract for the whole of the stations on this line, had the works been able to devote themselves entirely to the demands of this company. In one room, of ample dimensions, there was the very interesting operation going on of preparing mosaic for various places where it is to be laid down. The process was to me somewhat of a revelation, as I had hitherto thought that this was always done on the spot where the work had to remain, as was done by the Romans. But I saw it being got ready here at Trevor for London work, but fixed face downwards on papers, so that at the London end it was necessary only to lay the sheets, upon which the design was set, face downwards upon the cement bed, and there it remained for all time. One large shed seemed full of large pigeon-holes; but this was a delusion, for the seeming pigeon-holes were but wooden bins, in which tiles of various shapes and sizes were stored, for despatch where and when wanted. The special "Adamantine" tiles were here in full force. These tiles, 3in. in thickness, are in great demand just now, and the works are turning out tens of thousands of this speciality alone. They are used in the hospitals, post offices, and other buildings where hard wear and tear is expected. Elsewhere there was to be seen a tile that one would imagine has been greatly in demand of late, for it bore upon it the portrait of Mr. Gladstone in relief. These Trevor works are not all. There are

OTHER WORKS IN THE NEIGHBOURHOOD

belonging to the same firm, and a walk across the valley to the other side of the river, and

through the village of Cefn (or, rather, past it, for one scarcely passes through it), leads to the works at which is to be seen the "Clay hole" itself, well worth looking at, especially by those who have never seen one, and who are of a geological turn of mind. The "hole" is neither dark nor dingy, as might be supposed; nor is it cramped for room. It is a huge quarry, in which, at the time of my visit, there were over 100 men at work, and yet they scarcely seemed visible, so vast was the space. In these works there is a most complete system of heating and drying apparatus, the effect of which is to keep the air in each shed at a constant and even temperature throughout the year, independent of the season, a point the value of which is by no means inconsiderable to the manufacturer of tiles and clay work generally. Here, as at Trevor, the goods are at once put on trucks at the works, the railway siding coming right into the heart of the works, and so saving all the cost of carting. How far the Welsh men and lads at these tileries are in love with the beautiful scenery in the midst of which they work I am not aware; but I could not help thinking, as I saw the clouds of smoke that are inseparable from the operation of tile and brick making, that Mr. Ruskin scarcely needed to "go" for the ironworks as the modern curse of the landscape when such an old industry as this can and must give out so much carbon. Yet once away from the immediate neighbourhood of the chimneys, the area of the natural display is so great and the area of the disturbing element so small by comparison that one wonders to think that the smoke is ever abused at all where the disproportion is so marked as it is at Ruabon and the district at the foot of the famous Vale of Llangollen.

A DEEP-SEA pier scheme is now nearing completion at Herne Bay. The old pier, which had been in existence some years, ran out to a distance of only 400ft., and was left at low tide high and dry. This has now been lengthened by the addition of 3320ft., making it the longest pier on the Kentish coast.

MR. W. E. RICKARDS, builder, of City Road, was summoned at Westminster by Mr. Dee, a Westminster sanitary inspector, for failing, after due notice, to provide proper sanitary appliances at a workshop in St. James's Court, Westminster.—Mr. Percy Gates, solicitor to the Westminster Vestry, supported the summons, and stated that the defendant was building large flats at St. James's Court, and though from 100 to 200 workmen were employed, and probably would be for two years, the sanitary arrangements were of the crudest and most outrageous nature—a menace to the health of the public.—Mr. Sheil asked how a building in course of erection could be styled a workshop.—Mr. Gates said there was no definition of a workshop or work-place in the Public Health Act, under which the proceedings were taken, but the definition clause in the Factories and Workshops Act, which would probably be accepted, was quite wide enough to cover a building in course of erection, or even a field where works were in progress.—Mr. Dee, the sanitary inspector, deposed that the shaping of bricks and ironwork in two sheds occupied the attention of a number of workmen.—Mr. Sheil did not think this temporary sort of business made the place a workshop in the ordinary acceptance of the word.—Mr. Gates: The Vestry ask you to hold that it is. The point has been carefully considered, and it would be intolerable if there was no remedy for such a great nuisance and danger to the public.—Mr. Sheil: That is all beside the real question, which is the construction of the Act of Parliament. If the Legislature, with its combined wisdom, does not in the Act define what a workshop is, I am not going to put a strained construction on it. I will adjourn the case for further argument.—The summons was accordingly adjourned, the magistrate telling the defendant it would be cheaper for him to have the necessary work done, as he should grant a special case, which would be pretty expensive before the Superior Court decided it.

Builders' Notes.

THE annual report of the Birmingham Building Trades Federation, just issued, comments on the flourishing condition of the building trades during the past year. The executive state:—"We looked upon 1896 as one of the best years in our memory, but 1897 has even exceeded that."

AN arrangement has been arrived at in London between a deputation from the Devonport Corporation and the promoters of the Plymouth, Devonport, and Stoke Tramways Company respecting the levelling of the steep gradient opposite the Naval Engineering College, Keyham. The terms agreed upon will be embodied in the company's Bill now before Parliament. The alteration is much more costly than was anticipated, the estimated outlay being £5000. It is understood that the raising of the roadway at the foot of the hill will necessitate an alteration of the entrance to Keyham Factory by the north gate.

THE tunnel under the Rock of Gibraltar has recently been completed. It has been constructed by Messrs. Topham, Jones, and Railton, contractors for the new Naval and Commercial Docks at Gibraltar, for the purpose of bringing stone for the breakwaters from the east side of the rock, avoiding the slow and awkward journey round the north front of the rock, which has hitherto been the route in use. The tunnel, which will probably be afterwards used for strategic purposes, is 1100 yards in length, 10ft. wide, and from 8ft. to 14ft. in height. It crosses the rock from west to east, rising on an easy gradient towards the east, and took thirteen months in boring, the greater part being through solid limestone. Compressed air rock drills were used for driving from the west, and in consequence the ventilation and progress were much better than from the east, where hand drills were used. The trucks of debris came out by gravity at the west end, but at the east a hauling engine was fixed for that purpose.

THE case of Pickers v. Lovatt, heard before Mr. Justice Bruce and a special jury in the Queen's Bench Division of the High Court, was a claim for damages for personal injuries suffered by plaintiff whilst employed on a building contract by the defendant, who denied all negligence.—Mr. Henry Lovatt, defendant, said he was a contractor, with headquarters at Wolverhampton, and had been in business forty or fifty years. In erecting permanent scaffolding for public buildings, he preferred to use chains instead of cords. He had used chains for fifteen years now in preference to cords, because he found they were safer for the workmen. He experienced several accidents with ropes, and therefore he adopted chains, although they were more expensive. For some reason or other London workmen did not like them, and when he started the building of the Bexley Heath Asylum for the London County Council he used ropes, but in consequence of several breaking, he went back to chains. On this particular contract—the building of Her Majesty's Theatre—he used nothing but new scaffolding and chains, which were procured from well-known manufacturers at Walsall and Cradley Heath. He did not give any personal superintendence to this work, as he had too much else to do.—Cross-examined by Mr. Ruegg, he said the chains were all examined carefully before they were sent out for use, and the manufacturers, for the sake of their reputation, would not, he thought, send out faulty chains. No men were killed at Bexley Heath, because the buildings were rather low. Chains were far safer if properly used. He was not aware that six chains broke in the building of this theatre, as no report was made to him, but if cords had been used no doubt fifty would have broken. He was most careful with his men, and tried to ensure their safety as far as was possible. There were only three accidents last year out of 4000 or 5000 men at work on

his contracts.—In reply to the Judge, he said, from inspection of the broken link, he could see no indication of a flaw.—Mr. Salter, counsel for the defendant, then addressed the jury for the defence, and submitted that no personal negligence had been proved against Mr. Lovatt. That was the real question in the case, because this action was not brought, as was usual, under the Employers' Liability Act. Therefore the same considerations did not arise as if action had been taken under that Act. The two previous actions which plaintiff had brought under that Act in the County Court against the defendant had both been dismissed, and without offering to pay any of the costs plaintiff had commenced this third and most unusual action, probably thinking he might get a verdict on the question of whether cords or chains ought to be used. That was not the point, however, and the only question was whether Mr. Lovatt had been guilty of personal negligence, which brought about this accident to the plaintiff.—Mr. Ruegg, for the plaintiff, submitted that Mr. Lovatt's system of using chains of this description for scaffolding was unreasonable and unsafe, and therefore he was negligent.—The jury, after considering the matter in private, returned a verdict for the defendant, but expressed the hope that Mr. Lovatt would see his way to make some compensation to the plaintiff.—Counsel said he would communicate that view to Mr. Lovatt, and judgment was entered for the defendant, with costs.

A CORRESPONDENT writes to a contemporary with reference to the North Pier at Tynemouth as follows:—"As no one appears to have touched upon the question of the material used in the construction of the above pier, I venture briefly to give particulars, with a view to comparison, and suggesting that this was the real cause of the structure being practically washed away. Large quantities of ocean-eaten magnesian limestone were deposited by hopper on the bed of the sea, and from time to time lengths of iron cable were lowered, so as to rest upon the said limestone as a binding element. When the deposit came near the surface, large blocks made of cement and the stone in question and moulded into blocks were by divers placed upon it, and after that freestone blocks. Now, with such decomposing material as the magnesian limestone and iron chain, it could only result in the mounds or banks giving way, when the superstructure was bound to do the same. It was absurd to suppose that in using such 'cheap and nasty' material you could possibly have a permanent structure, or even yet one of ordinary life.

"In comparison, let me ask you to consider Dunstanburgh and Bamburgh Castles, or, perhaps, even more to the point, are the Farne Islands pinnacles, where, lying off as I have done, and realising that all the originally-surrounding limestone sedimentary rocks have been disintegrated and washed away, leaving only the intrusive basalt to beat back the ocean surf from a sea whose bed is there full forty fathoms deep, and which it has probably done for millions of ages. It reasonably suggests itself to an enquiring mind to ask the question: Is it possible to get material anything like this to construct a breakwater with? To such a question I would answer: It is. If an additional question be added: Is it practicable? I would again answer: It is; for I may state that it is within my own knowledge that certain basalt can be melted like metal and cast into moulds, although requiring much more care and time in cooling. Stone of this character can be found in the British Islands, and could be got by sea to North Shields—possibly, in fine weather, to Tynemouth Haven. Were a trial made, I would suggest casting into blocks 10ft. by 4ft. by 2ft. 6in., which would weigh about seven tons, a size well suited to form a breakwater starting at the shore end from a point just north of the lighthouse, and placed in a straight line to the pier end. The result would eventually be—after the decomposing magnesian limestone had been entirely washed away, and the basalt blocks added from time to time—a breakwater of really permanent character."

Surveying and Sanitary Notes.

THE House of Commons Committee on Police and Sanitary Regulations, presided over by Sir Stafford Northcote, have just concluded their inquiry respecting the Middlesex County Council Bill. In substance the Committee have granted, with certain modifications, the powers asked for by the County Council, but have refused to pass the clause requiring the canal company to furnish more water for flushing purposes. They have also refused to grant any fresh regulations respecting the Hendon reservoir.

THE contractors for the main drainage works at Dublin, Messrs. H. and J. Martin, are carrying on the work very vigorously. The extensions on the northern side may be said to be practically completed, including the Clontarf section. A difficult portion of the operations was the tunnelling under the Royal Canal and the Tolka, but this, too, has been overcome successfully. Excellent progress is being made with the Kilmainham section, which is well advanced. On the southern side close beside O'Connell Bridge, the drainage works are in active progress eastward, but it is not intended to open the southern line of quays between O'Connell Bridge and Kingsbridge for some time—at least until traffic facilities are reopened for trams, cars, and other vehicles on the north side of the Liffey.

THE Barmouth New Waterworks have been formally opened. These new works are situated among the Merionethshire mountains, and the reservoir contains a storage of 100,000,000 gallons, of which 52,000,000 gallons are for the supply of Barmouth, and will supply a population of 20,000 for 104 days. The works cost nearly £30,000. At a banquet held in connection with the opening ceremony Mr. T. W. Russell, in reply to the toast of "The Local Governing Bodies of the United Kingdom," spoke of the enormous and increasing work of the Local Government Board, and said that since its establishment it had sanctioned the spending upon sanitary work of £162,760,000. Whereas before the establishment of the central authority the expenditure upon sanitary work in the kingdom during ten years was only £2,956,000, the sum spent during the last ten years was £46,000,000.

SOME few years ago the Corporation of London, with a view to testing the asserted monopoly of the New River Company to supply water to the City at a price reckoned on the rateable value of the premises without consideration as to the amount consumed, sank an artesian well in Stoney Lane, Houndsditch, to supply the artisans' dwellings there. The quantity of water raised daily is about 33,000 gallons, or over 10,000,000 gallons a year. Of this quantity about 22,000 gallons a day, or 7,000,000 a year, are used for the purposes of the dwellings, leaving an available daily surplus of 11,000 gallons. The average quantity of water used annually for street watering and washing is 41,000,000 gallons, for which the New River Company charge 9d. per 1000 gallons. The annual cost of pumping the water now supplied to the artisans' dwellings is £180, or about 5½d. per 1000 gallons, while the cost of the well has been £5610. The original charge made by the New River Company for a constant supply to the dwellings was £84 per annum. Thus the Corporation, by its experiment, has not only sunk nearly £6000, but is losing £100 a year in the expense of supplying the water. There is no means, without great additional expense, of utilising the surplus daily supply for washing the streets, and the Corporation has decided not to attempt it.

THE Board of Trade has decided to sanction the overhead trolley system of electric traction on the Blackpool Corporation tramways on the condition that the special regulations which will be made by the Department are strictly complied with.

PARIS ABATTOIRS.*

By R. STEPHEN AYLING, A.R.I.B.A.

(Continued from page xxxvi.)

THE "Bouveries" (E. and F. Fig. 1) mentioned in the last article, are grouped round large open courts, in which the beasts are kept during the day, and are provided with stone drinking troughs. They are handsome stone structures, two stories in height, the ground floor being used as stables and the upper floor as a store for hay and food for the cattle. We shall illustrate one of the blocks of "Bouveries" on the northern side of the canal in a subsequent article. They are all similar in general arrangement and fittings.

Between these buildings and the fountain is the "Parc de Comptage" (H. Fig. 1) to facilitate the counting of the animals as they enter the markets from the Rue d'Allemagne. This consists of a series of parallel wooden barriers about 4ft. high, with lozenge-shaped enclosures, in which the men who are counting stand.

One-half is reserved for beasts and the other for sheep, who are driven through in single file.

The wooden building I. (Fig. 1) is devoted to the "Service Disinfection," and it is here that all the disinfectants, hose, apparatus, &c., for the cleaning of the markets are kept. This work is very thoroughly done, and a large

portions of which brackets are fixed and above them lattice girders. The central portion of the roof is raised and the upright part between left open, thus allowing cross ventilation. Ventilation is also obtained by the large dormers, which are provided with glass louvres. A central and two side roads run laterally from end to end of the market, with roads of lesser width between the cattle-pens. These latter are formed by cast iron columns 3ft. 3in. high and about 6ft. apart, with two horizontal circular rails connecting them, to the upper of which the animals are tethered. The whole of this market is paved with granite blocks. On market days, when this enormous building is filled with oxen of all kinds, the sight is one not readily forgotten.

result noted by the clerks engaged on this work.

The pens are divided by iron standards 33in. high, with square iron balusters between them.

A small office for the veterinary inspector is provided on the west side.

At the northern end of this market is an additional series of pens for pigs (M. Fig. 1). They are separated by dwarf brick walls with iron railings and gates at either end. Double troughs for food are provided in each division. A detail of this portion is shown on Figs. 6 and 7. In the centre of this block is another weighing place fitted with two tables, and is somewhat similar in plan to those in the pig market.

Beyond these pens is a large "Porcherie"

THE ABATTOIRS & MARKETS OF LA VILLETTE, PARIS, CENTRAL MARKET FOR OXEN.

staff of men are employed in the service. Each afternoon when the sales are over the animals are driven to their stables, and then the whole of the floors, roads, and courtyards are cleansed by means of standing hydrants, and the whole strewn with powdered disinfectants.

Facing the fountain is the magnificent central market J (Fig. 1) for the sale of beasts, and it measures about 280ft. by 767ft., covering an area of nearly five acres. A portion of the plan, one-half elevation and one-half section, are shown on Figs. 2 and 3.

As will be seen from the drawing, the materials employed in the structure are cast and wrought iron and glass. The roof is supported on cast iron columns, on the upper

* This series deals with the construction of the Cattle Markets and Abattoirs of La Villette and La Rive Gauche, Paris.

Beyond the market is a large open space planted with trees, and two restaurants and buffets for the cattle dealers and employees (K. Fig. 1).

Parallel with the central market, on the eastern side, is the smaller market (L. Fig. 1), for the sale of pigs and calves. The size of this building is about 280ft. by 450ft., thus covering an area of nearly three acres. A portion of the plan is shown on Fig. 4 where it will be seen a wide central road runs longitudinally through the centre, with roads of less width on the right and left.

Four places are provided in this market for weighing the cattle, of which a detail is given on Fig. 5. To the extreme left and right are passages, divided by barriers, for the drovers. In the centre are desks and indicators. The animals are driven singly between the barriers and pass over the weighing tables, and the

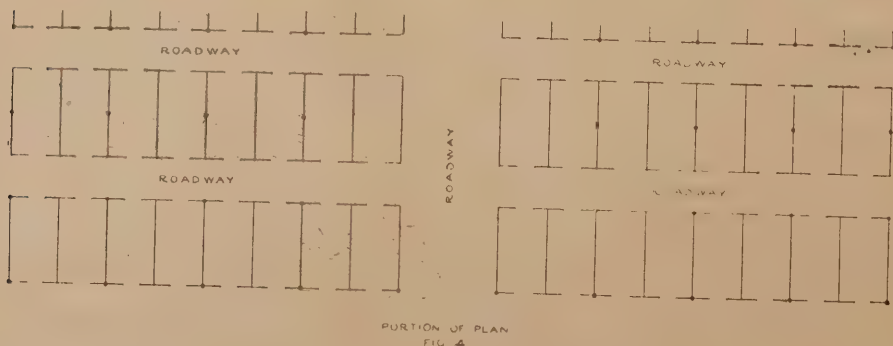

(N. Fig. 1), or stable for pigs. This building is divided into fifty-eight lairs, in which the animals are kept between the times that they are sold and killed.

(To be continued.)

PROFESSOR FLEMING's report on the scheme of the Town Council for the electric lighting of Douglas has been received, and will shortly be issued. His estimate of the cost of the smaller scheme submitted, namely the lighting of the Promenades, Victoria Street to Finch Road, and Duke, Strand, and Castle Streets, is £30,000.

The Leeds Corporation Streets and Sewerage Committee have completed arrangements for the acquisition of properties in Land's Lane, Jack Lane (Hunslet), and Waterloo Road (Hunslet), and notices to treat have been served for the acquisition of property in York Street to give accommodation for the extended tram service. The Committee have decided to hold a sale of surplus lands, acquired in recent street improvements in various parts of the city, at an early date.

At a recent meeting of the Leigh Council a heated discussion took place on the condition of the Leigh sewers, which cost £28,000 a few years ago. Several members said that some of the main sewers were gradually silting up with solid mud through the fall being scarcely perceptible. It was argued that had a deep sewer system with pumping arrangements been adopted instead of the present nearly flat sewers, the cost would have been about £50,000 more. Further discussion was postponed until the Council's surveyor has fully reported upon the condition of all the Leigh sewers.

WEIGHING APPARATUS IN MARKET
FIG. 5

Trade and Craft.

MESSRS. MARK FAWCETT AND CO.

The constructional steelwork in connection with the recently-opened additions to the University Extension College, Reading, to which we refer elsewhere, has been supplied by Messrs. Mark Fawcett and Co., of 50, Queen Anne's Gate, Westminster, S.W., whose patent system has been adopted in the laying of the floors.

THE HYDRO-INCANDESCENT GAS LIGHT CO.

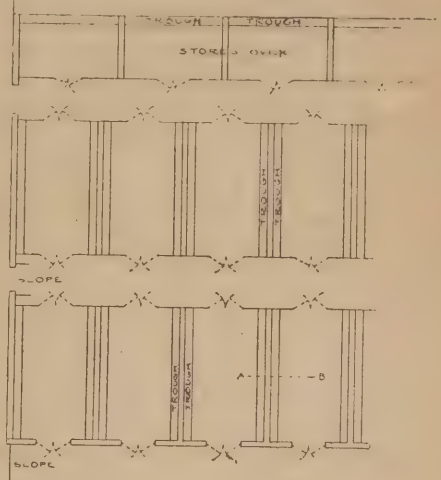

We publish on another page the prospectus of the Hydro-Incandescent Gas Light Co. The object of the undertaking is to acquire the Hydro-Light and a contract with the Welsbach Incandescent Company, whereby the latter undertakes to manufacture and sell the ap-

paratus and to pay over to the Hydro 30 per cent. of the gross profits. The Company is being brought out with a capital of £200,000. The chairman of the board will be Sir William Robinson; the brokers, Messrs. Lumsden and Myers; and the general manager, Mr. Augspurg, late of the Welsbach Company.

SOME SANITARY SPECIALITIES.

In the new underground lavatory accommodation which has been provided for the city of Leeds in the large square immediately outside the joint railway stations, and to which we recently referred, very considerable difficulties, due to local conditions, have been overcome by the architect in a most satisfactory manner. We notice that the specialities of several firms have been fixed, fireclay lavatory basins being supplied by Messrs. Twyford and Messrs. Adams and Co.; the closets being by Messrs. Twyford and Messrs. Doulton. The many urinals, which form the chief sanitary feature here, are supplied by Messrs. Adams and Co. from their special types, somewhat modified in architectural detail, to accord with the design of the structure itself. The urinal has curved back and sole in one piece of highly glazed ware, with front outlet to drain and dividing pillars; glazed ware-cupping surmounts the backs, and above these are short divisions and backs of glazed ware; black marble floor tiles are used, and the flushing is effected by means of Adams' now well-known automatic syphon tank. These tanks effect great economy in the use of water for flushing purposes, for whilst under the old method a constant flow was allowed, often too small to adequately cleanse the urinals, with these tanks a small feed of water delivered from the Water Company's main gradually fills the tank, and then when full the apparatus delivers its contents instantly and with considerable force to the urinals; thus an intermittent and powerful flush supercedes the continuous and imperfect supply hitherto used, and considerable saving of water results with increased cleanliness of the urinal flushed. The architect is Mr. Bakewell,

from whose design the undertaking was completed. We believe the glazed bricks were manufactured by the Farnley Iron Company. The plumbing work was carried out by Messrs. Slater, of Leeds, whilst Mr. Whiteley was clerk of works.

PROPERTY & LAND SALES.

HAMPTON and SONS beg to announce that their AUCTIONS of LANDED ESTATES, town and country Residences, Investments, Business Premises, and other Properties, are held MONTHLY at the MART, Tokenhouse-yard, E.C.

Auctions can also be held on other days, in town or country, by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.

June List of Estates, town and country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to Hampton and Sons (Ltd.), 1, Cockspur-street, S.W., or by post, three stamps.

Auction and Estate Offices, 1, Cockspur-street, Pall Mall, S.W.

FINCHLEY ROAD.

Occupying a pleasant position in this favourite residential locality, close to Marlborough-road Station, with frequent service of trains to the City and West End, and within a short drive of Regent-street.

The conveniently placed, double fronted, detached Family Residence and Stabling, known as Bishop's Lodge, 35, Finchley-road, N.W., substantially built, and standing well back from the road, approached by a carriage-sweep. Held for 39 years unexpired from Michaelmas next, at a ground rent of £20 per annum. Possession on completion of the purchase.

Also the Two well-placed and attractive, semi-detached Houses, Nos. 5 and 15, Finchley-road, N.W., each containing six bed rooms, bath room, three reception rooms, conservatory, and usual domestic offices. No. 5, Finchley-road, is let upon a five years' lease from September, 1897, at £90 per annum, thus forming a good investment. Both held on lease, having an unexpired term of about 25 years, at a ground rent of £11 per annum each. Vacant possession of No. 15 on completion of purchase.

HAMPTON and SONS will SELL the above by AUCTION, at the Mart, E.C., on WEDNESDAY, JULY 13, 1898, at 2 o'clock, in three lots (unless previously disposed of by private treaty). Detailed particulars and conditions of sale can be had of Messrs. FOSS and LEDSAM, Solicitors, 5, Fenchurch-street, E.C.; and of the AUCTIONEERS, 1, Cockspur-street, S.W.

TOOTING.—In the main road from Streatham to Mitcham.—Ripe Building Estate.—Close to Streatham and Tooting Junction Stations and the Recreation Ground.

WEATHERALL and GREEN will SELL by AUCTION, at the Mart, City, on MONDAY, JUNE 27th, at TWO, in one lot, 53 acres of valuable FREEHOLD BUILDING LAND, ripe for immediate profitable development, situate opposite Gorrings Park, and having a good frontage to Streatham-lane, possessing great capabilities for building. In addition, a valuable bed of gravel underlies most of the land. Let on lease determinable at Michaelmas, 1899, at £160 per annum.—Messrs. GROVER, HUMPHREYS and SON, Solicitors, Temple. Particulars of the AUCTIONEERS, 22, Chancery-lane.

TO BUILDERS AND OTHERS.—Messrs.

FULLER, HORSEY, SONS, & CASSELL are instructed by the proprietor, who is retiring from business, to SELL by AUCTION in lots, on the PREMISES, 33, Boundary-road, St. John's Wood, on WEDNESDAY, JULY 6th, at TWELVE o'clock precisely, BUILDER'S PLANT and MACHINERY, including a combined circular saw bench and irregular moulding machine, a 42in. drag saw bench, mortising and boring machine, vertical engine and boiler, shafting, 200 scaffold poles, 20 dozen cords, 400 scaffold boards, putlogs, steps, ladders, benches, cramps, &c.; stock of well-seasoned timber, comprising about 1000ft. super mahogany, 1500ft. super wainscot, cut stuff, quartering, mouldings, 50 squares flooring and matching; also 30cwt. white lead, oils, turps, varnishes, and painters' materials, boxes, jacks, plumbers' brass work, solder, sheet lead and pipe, ironmongery, &c.; 2 spring carts, hand truck, chaff-cutter, and other effects.—May be viewed by order, and catalogues had on the premises, and of the AUCTIONEERS, No. 11, Billiter-square, E.C.

CHEAP FREEHOLD BUILDING LAND, ripe for development by a formation of roads, and plotting, either for re-sale, or building upon at once attractively designed detached houses, and pairs of moderate size, &c. It is situate within about half a mile of the High-street, and a trifle over a mile from the Station at Sutton, Surrey, possesses a very long frontage to excellent hard road. The spot is very rural, and high and dry. Area about 80 acres. Details to principals only.—ALEX H. TURNER and Co., 199, Piccadilly.

TO BUILDERS.

The Freeholder of a large suburban Estate (S.W.) wishes to meet with ONE or TWO BUILDERS accustomed to building good-class suburban property of from £60 to £120 a year rental. Main road, prettily wooded sites for houses. Plenty of ground to each plot, several having tennis lawns; main drainage; cricket and tennis clubs and three golf courses within a mile. Eight miles from Royal Exchange. Some shop plots adjoining railway station on main road. The land will be sold or let with restrictions, and advances can be had. Unquestionably one of the best things going at the present time for the right man.

Freeholder's Surveyors and Architects, Messrs. CHESTERTON and SONS, 51, Cheapside, E.C.

TO BUILDERS.—FREEHOLD BUILDING LAND.—West Green Lodge, West Green road, Tottenham, almost immediately opposite the West Green Station.—To LET, by TENDER, on JUNE 24th, 1898, a very eligible piece of LAND, with frontages to three main roads, ripe for building, and suitable for the erection of eleven shops and nineteen small private residences.—For forms of Tender apply to Mr. C. E. JACKSON, Architect, and Messrs. GEO. and WM. WEBB, Solicitors, 39, New Broad-street, E.C.

MESSRS. GREEN and SON, AUCTIONEERS and SURVEYORS, 28 and 29, St. Swithin's-lane, London, Beg to announce that their SALES by AUCTION of FREEHOLD, LEASEHOLD, and COPYHOLD PROPERTIES, Ground Rents, Life Policies, and Reversions take place at the MART on the LAST FRIDAY in the MONTH, and on such other occasions as may be arranged.—Particulars are invited 21 days prior.

MESSRS. GREEN and SON undertake SURVEYS and VALUATIONS of LAND and HOUSE PROPERTIES, as well as Machinery and Plant, for

Ratings, Compensations, Partnerships, Assessment Appeals, Estate Duties, Dilapidations, Fire Losses, Mortgages, and other purposes. Estates managed and rents collected under Receiver-ship and other powers.

MESSRS. GREEN and SON invite the attention of persons requiring money on mortgage to their

MORTGAGE LIST.

founded in the year 1853 (entered at Stationers' Hall), which contains particulars of sums of money in the hands of trustees and solicitors by whom they are instructed to obtain securities.

Auction, Land, and Estate Offices, 28 and 29, St. Swithin's-lane, E.C.

SUTTON, SURREY.—FREEHOLD BUILDING LAND for SALE, in cheap lots. Practically no restrictions. Roads made, gas and hot-water laid on. Free conveyances. Any sized plots. Payment by instalments if required.—BROOKS and HELLER, 8, Old Jewry, E.C.

MESSRS. FORTESCUE and BRANSON have received instructions to SELL by AUCTION, at the MART, Tokenhouse-yard, E.C., on MONDAY, JULY 4th, 1898, at two precisely:

The four long Leasehold Dwelling Houses and Laundries, known as 6, 20, 22, and 24, Wendell-road, Shepherd's Bush. Let and producing £180 per annum, tenants paying rates and taxes. Held for long terms at moderate ground rents.—Solicitors, Messrs. Church, Rendell, Todd, and Co., 9, Bedford-row; and Messrs. Ford, Lloyd, Bartlett, and Co., 33, Bloomsbury-square, W.C.

By order of the Executors of the late Mrs. Shepperson.—A charming double-fronted Residence, with room to erect a stable at the rear, known as 17, Ryelott-road, Ravenscourt Park. Let at £60 per annum. Held on a long lease, at a moderate ground rent.—Solicitors, Messrs. Pearlless and Sons, East Grinstead. Particulars and conditions of sale of the respective SOLICITORS; at the Mart; and of the AUCTIONEERS, 54A, Goldhawk-road, Shepherd's Bush, W.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ARCHITECTURAL INSTITUTE and **CIVIL SERVICE TECHNICAL EXAMINATIONS.** Preparation by correspondence, personally or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

NOTTINGHAM.—Old-established SANITARY PLUMBER'S BUSINESS, large jobbing and contracting connection, for DISPOSAL, owing to death of proprietor; main thoroughfare; recently fitted up workshops; splendid modern plant; unique opportunity for wholesale plumber; large contracts running.—Apply MELLORS, BASDEN, and MELLORS, Estate Agents, King John's Chambers, Nottingham.

WATERPROOF COVERS, made from very best Navy canvas, 12ft. by 9ft. 15s.; 15ft. by 9ft., 18s. 9d.; 18ft. by 12ft. 25s.—Any size, at 1s. 3d. per square yard, can be sent on approval from H. J. GASSON, Government Contractor, Ely.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

PROSPECTUS

This Company has been formed for the purpose of acquiring the whole of the British, Indian, Australasian, South African, and Canadian patent rights, and all other rights incidental thereto, of the Hydro-Incandescent Gas Light, and the benefits of the valuable licence with the Welsbach Incandescent Gas Light Company hereinafter referred to.

This Company has had transferred to it a contract and licence with the Welsbach Incandescent Gas Light Company whereby the latter undertakes, for a minimum period of five years, to manufacture and sell the apparatus, paying over to this Company 50 per cent. of the gross profits, not charging anything for establishment expenses, advertising, or cost of selling and placing on the market, and during the continuance of the licence not to make use of any other hydraulic gas pressing apparatus; and that, in the further event of the contract being determined, this Company is to be deemed to have a licence to use the Welsbach mantles and burners, and the Welsbach Incandescent Gas Light Company are to supply such mantles and burners at a discount of 30 per cent. from the current price.

The Hydro-Incandescent Gas Light embodies a most ingenious, practical and useful advance in lighting power for hotels, theatres, concert halls, shops, manufactories, railway stations, streets, barracks, docks, lighthouses, foundries, cotton and other mills, and all other places where brilliant illumination and hygienic conditions, combined with safety, are desired.

The apparatus by means of which the advantages of this light are achieved is exceedingly simple, and can easily be fitted to existing gas and water supplies. The resultant light is superior to the electric arc light, being absolutely steady and devoid of the bluish flickering glare which characterises the latter. Notwithstanding its greater illuminating power, the light is more salutary than any other form of artificial light, owing to the fact that it more nearly approximates the sun's rays, and shades of colour are as readily distinguishable as in the daylight.

One of the effects of the hydro treatment is to remove impurities from the gas, which, under the old conditions, escaped through the flame. Another important feature in connection with the Hydro-Incandescent Light is that no covering whatever is required. It burns quite steadily and effectually, even in a dusty factory, without globe or chimney, but for decorative purposes the usual gas globes may be employed.

Beyond the great monetary saving effected by dispensing with chimneys, and the economy of mantles, under the new system, one burner will do the work that many were required to accomplish. A single burner consuming ordinary gas as supplied from the main of a gas company can, if desired, give a light up to 1500 (fifteen hundred) candle power, at a much lower price than an electric arc lamp.

The Welsbach Incandescent Gas Light Company use for the distribution of their goods no fewer than 16,000 agents and traders in the United Kingdom. Through the contract referred to, the Hydro-Incandescent Company will practically avoid the expenses and delays attendant on organising an establishment of its own; therefore, this Company starts under the brightest auspices.

England, without doubt, is one of the largest fields for the sale of Incandescent Burners and Mantles, and it is stated that in the United Kingdom there are over 200,000,000 gas jets in use, and that not five per cent. of these are Incandescent Lights. The future prospects therefore for the Hydro-Incandescent Apparatus deserve close attention.

In addition to the income to be derived from the Company's operations in Great Britain, the Indian, Australasian, South African and Canadian Patents are of high value, and the Directors feel confident that a considerable revenue is secured for the Company from its inception.

The validity of the letters patent which the Company will acquire has been thoroughly investigated. The following is the opinion of Mr. J. Fletcher Moulton, Q.C.:—"I have examined the specification and claims of the letters patent granted to Rothgesser, No. 8186 of 1897, and the prior specifications disclosed by the search in British and American specifications by Messrs. Jensen and Son, Patent Agents, and I am of opinion that the letters patent are valid and adequately protect the apparatus as made."

The purchase price of the patents and all rights for Great Britain, India, Australasia, South Africa, and Canada, together with the benefits of the licence to the Welsbach Incandescent Gas Light Company Limited, has been fixed by the Vendors, who are the promoters, at £150,000, payable as to £113,334 in cash, and the balance in cash or partly in cash and partly in shares, or £66,666 in shares at the option of the Directors, being the maximum allowed by the rules of the Stock Exchange, leaving £20,000 for working capital.

The Vendors are also entitled, under a valuable Contract dated the 3rd day of June, 1898, and made between the Internationale Hydro-Press-Gas Compagnie Limited, of the one part, and themselves of the other part, to an option, until the 31st December, 1898, to purchase the United States, Russian, French, Belgian, Italian, Austrian, and Hungarian patents, or patent rights, relating to the Hydro-Incandescent Gas Light, or any of them, subject as to the United States and Belgium patents to certain negotiations which have been already entered upon by the Internationale Hydro-Press-Gas Compagnie Limited, but the benefit of which will be assigned to the Vendors, and by their Contract with the Company they have agreed to pay to the Company 25 per cent. of the gross profits made by them on the resale of these patents, or patent rights, or any of them.

The following contracts have also been entered into:—

Contract, dated the 17th day of March, 1898, and made between the Internationale Hydro-Press-Gas Compagnie Limited, of Hamburg, Germany, of the one part, and Maurice Joseph Wells and Samuel Husbands Beckles of the other part, being the agreement under which the Vendors are acquiring the premises from the present owners, the above-named German Company. Contract, dated the 4th day of June, 1898, and made between the said Maurice Joseph Wells and Samuel Husbands Beckles of the one part, and the Company of the other part, being the contract under which the Vendors sell the premises to the Company at a profit, as modified by agreement endorsed thereon, dated June 3rd, 1898, and made between the same parties. Also a license, dated the 19th day of February, 1898, made between the Internationale Hydro-Press-Gas Compagnie Limited, of Hamburg, Germany, of the one part, and the Incandescent Gas Light Company Limited, of the other part, being the license above referred to, and as regards the interests of the Incandescent Gas Light Company Limited, vested in the Welsbach Incandescent Gas Light Company Limited.

Applicants are to be deemed to have full notice of the contents of the above contracts and license, and to have agreed with the Company as a Trustee for the Directors and other persons liable not to make any claim whatsoever, or to take any proceedings under Section 38 of the Companies Act, 1867, or under the Directors' Liability Act in respect of any non-compliance with the said Section, or any mis-statement in the Prospectus made by the Directors under the bona-fide belief that it was true.

There are other agreements and arrangements made by the Vendors in connection with the promotion of the Company and the providing of the capital thereof to which the Company is no party, which may be within the said Section 38 of the Companies Act, 1867, and applicants for shares shall be deemed to have full notice of these agreements, and to have waived all rights to be supplied with particulars of such contracts, and to have agreed with the Company as a Trustee for the Directors and other persons liable in manner above mentioned.

The Vendors will pay all costs in connection with the formation and registration of this Company down to the first general allotment of shares, except the stamp duties on the agreements for purchase and brokerage.

The Memorandum and Articles of Association of the Company, and the said covenants and agreements and license, together with Mr. J. Fletcher Moulton's opinion, can be seen at the offices of Company's Solicitors.

Application will be made in due course to the Committee of the Stock Exchange for a special settlement and official quotation.

Applications should be made on the form enclosed, and forwarded to the Bankers of the Company with the amount of deposit. When no allotment is made the deposit will be returned in full, and if the number of shares allotted be less than that applied for, the surplus will be credited in reduction of the payment on allotment, and any balance will be returned.

Copies of the Prospectus and Forms of Application for Shares can be obtained at the Registered Offices of the Company, or of the Bankers, Solicitors, or Brokers. London, 15th June, 1898.

An Architectural Causerie.

Our Street Crossings.

THE proximate opening of the City and Waterloo Railway, and the progress of the other great subterranean railway works beneath the open space on which the Bank of England, the Royal Exchange, and the Mansion House front, have called attention

of the perils of the streets, and fares forth across the most tumultuous assembling-places of traffic with an absolute disregard of danger which stands him in good stead, until at last even his coolness is of no avail, and he is bowled over by that terror of the streets—the silent, rubber-tyred cab, and taken off to the hospital. One need not be an alarmist to point out these facts. The only reason why they are not more patent to the ordinary newspaper reader is that the editors of our morning papers have not yet discovered the annual report of the Chief Commissioner of Police to be the raw material for many sensational articles, and have not yet worked the subject up. When this official literature is discovered and duly exploited, the Man in the Street will know all about it, and will want to know about the subways or the footbridges which we ought to have for the proper avoidance of the worst crossings in London. Then, and only then, we shall be by way of getting

ground communication for that thronged pedestrian traffic which surges about that central point where the Bank stands, and where Queen Victoria Street, Cornhill, Lombard Street, King William Street, Cheapside, Prince's Street, and Throgmorton Street converge. There are a dozen or more points in London where such communication is most ardently to be desired. What London citizen does not know that dangerous pass at the City end of London Bridge, where a constant stream of contending heavy traffic clashes at the confluence of Gracechurch Street with Cannon Street and King William Street? And again, one has only to instance that point where Cheapside Newgate Street, St. Paul's Churchyard, and St. Martin's-le-Grand pool their respective vehicular throngs, for it to be recognised that some other communication than that now existing between the two sides of those thoroughfares is demanded. It may readily enough be granted that these subways will

to that long-standing topic of discussion—our street crossings—and people are beginning to ask how much longer we are to be content with seeing the heavy lorry, the lumbering omnibus, and the swift and lethal hansom cab take toll of human life in our crowded thoroughfares, for lack of some safe and ready communication overhead or below ground. Only a careful reference to the returns of the Metropolitan Police could show exactly how fatal our crowded street crossings are, not only to the aged and the infirm, but to all alike; for your average Londoner reck little

them, and the lieges no longer be obliged to take their lives in their hands with every recurring day. That the dangers of these crossings are recognised, is evident from the care with which the City of London authorities provided that (as the price of withdrawing their opposition to the Bills of the City and Waterloo, Central London, and City and South London Railway Companies) those companies should make and maintain an extensive series of subways which would give access, not only to their several stations, but would also provide for an under-

not be things of beauty; that, indeed, they are the unwilling price we must pay for our proud pre-eminence among the busy cities of the world; but that they are necessary evils none will be found to deny. Nor will many be found to declare for the only alternative—overhead bridges—which would be at once a very real nuisance and an intolerable eyesore. Can we imagine such things, say, at Ludgate Circus; at that perilous passage at Blackfriars where Queen Victoria Street and the Victoria Embankment join on a steep gradient and at a sharp curve, and are intersected by

New Bridge Street? Can we think of such a possibility at that other dangerous crossing, at Hyde Park Corner, and yet remain unmoved? But, on the other hand, can we longer defer our subways, and let our fellow-men and women perish of the perils of the streets?

C. G. H.

The Late Lamented, and its Successor.

WHEN the Metropolitan Board of Works deceased some years ago, un-
honoured, if not unsung, full of years and iniquities of various sorts, great were the rejoicings of the municipal reformers. To the late Mr. J. B. Firth in great measure, and to the Daily Telegraph in almost equal degree, we owe that successful agitation which finally brought about the burial of the so-called "Board of Perks" and the birth of the London County Council. Shall we ever forget the crusade of the Daily Telegraph, carried on under that lilting war cry of "Why Should London Wait?" We think not. Those were the strenuous days of the Telegraph, and it rode its hobbies hard; and so, with the aid of the Municipal Reform League, and a complaisant Conservative Government, we got our brand new authority, and were as pleased with it as a child with a new toy—for a time. But the glamour has long since worn off that plaything. As a nursery for certain political prejudices, as a kind of ante-room or training-ground for Parliament, the L.C.C. has its uses; but not to that end was it created. As constituted during its last three terms, the London County Council has striven to usurp many of the functions of Imperial Parliament, and, finding its efforts so far in vain, has sulked and refused to put in hand many of those public works for whose furtherance it was primarily created. "Withhold 'Betterment'" say those fractious Councillors, "and we will delay public improvements"; and so many of London's crying needs still go unsatisfied. Such works as have been carried through have been advertised as thoroughly as ever soap or cocoa have been. It is not the policy of the L.C.C. to: "Do good by stealth, and blush to find it fame." Neither, indeed, was it precisely the policy of the late lamented Board of Works; but at least that defunct body did not bang the big drum as its successors do. Works were done then—and quietly. To the Board, let us not forget, we owe the Victoria Embankment, Northumberland Avenue, Holborn Viaduct, Shaftesbury Avenue, and Charing Cross Road, to name but a few of the more important works of from thirty years to ten years ago. That record should be sufficient to discredit the campaigns of praise and apology which the fuglemen of the L.C.C. have, at one and the same time, entered upon. This is not to say that the Council has been idle. It has, on the contrary, been particularly busy in the matter of public improvements—so far as discussion of them goes. We do not remember how many schemes have been drafted so far for that urgent necessity, the new street from Holborn to the Strand; but newer and different plans are even now in the making, although for a considerable time past the Council has possessed Parliamentary powers for a scheme adopted long ago. Holywell Street stands where it did, although we recollect with the utmost distinctness that all the enterprising illustrated papers of five years ago illustrated it as a thoroughfare presently to be demolished. Folks took the London County Council at its word in those days. We have learnt better since.

F. F. S.

A KEY TO ENGLISH ANTIQUITIES.*

By ELLA S. ARMITAGE.

THE authoress of this book states in her preface that her object is primarily "to bring a great pleasure within the reach of many persons who would never think of themselves as antiquarians," and that she aims at "putting into the hands of the people of Sheffield and Rotherham a key to the antiquities of their neighbourhood, which will help them to understand and enjoy antiquities all over the kingdom." That object should be attained if the persons whom she aims at instructing and interesting can be induced to take up her book and read it through; but it is exceedingly difficult in these days of half-penny periodicals to persuade those who are not already interested in a matter to take up a book which professes to instruct, and read it through, and most of those who are already interested would desire fuller information than is to be found in Miss Armitage's work. Apart from this insufficiency, few faults are to be found. The book is well arranged and clearly written, the various monuments are described from personal knowledge, and the works of standard authorities upon the historical and archaeological remains of the district have been consulted and are freely quoted. It commences with an historical introduction, which gives a short sketch of the vicissitudes which Sheffield and its neighbourhood have experienced in the course of ages, and of various persons of more or less importance historically who have been connected with them, terminating with Bess of Hardwick, Countess of Shrewsbury, that great builder and masterful woman, to whom posterity owes Hardwick Hall and Bolsover Castle, and who also rebuilt Chatsworth. Then the body of the book commences with a chapter in which the subject of prehistoric remains is treated, and earthworks of various kinds are fully described; Roman remains (which are of the slightest kind) are mentioned, and later earthworks also. Then follows a short summary of the development of Architecture in England, with notes of salient differences of style for the guidance of the unlearned. Next, Norman castles are treated of, followed by those of later date, and the development of the English country house from them. "The Mediæval Church and Monasticism" leads to an account of Roche Abbey, followed by a chapter on parish churches in general, and another on tombs and churchyard crosses, which also contains a slight sketch of the changes in English costume from the twelfth century to the sixteenth, while in an earlier chapter are a few notes on that of monks and canons; and a long gazetteer-like chapter terminates the body of the book, with descriptions of the various parish churches arranged alphabetically. From a note in the preface, naming four unvisited churches, this chapter appears to be exhaustive. For the convenience of students, whom the authoress wishes to lure on to the study of archaeology, a glossary of architectural terms is added, and a pretty long list of works, by means of which they can pursue that study, if they so desire. All through the authoress has kept the unlearned before her mind's eye, making her book a compound of guide book and manual. The illustrations are very poor for the most part, though there are plenty of them, and also a map of the district. The appearance of this book may be welcomed as a local attempt to interest inhabitants in the antiquities of their own district, and one may hope that others will follow in the same path as Miss Armitage, taking up other districts in the same manner, for such books, illustrated more adequately, would be of great use to students of local antiquities all over the kingdom.

S. S. G.

* "A Key to English Antiquities: With Special Reference to the Sheffield and Rotherham District." By Ella S. Armitage. Sheffield: William Townsend, 1897.

THE LIKENESS OF CHRIST.

IT is reported that a photograph has been obtained which reproduces the exact portrait of our Saviour. The following is the description given by a Canon of the Turin Cathedral who has had occasion to examine the plate:—"The Redeemer, who miraculously left the imprint of His sufferings and the lines of His body on the shroud which enveloped Him in the tomb, has miraculously reappeared on a photographic plate with a perfection of detail that causes stupefaction. The noble figure has come forth anatomically elegant, perfect, and divinely beautiful. The countenance is still marked with ineffable suffering. All the details are there—the minutiae of the beard, the hair, the profile, the wounds, the welts, the mark of the rope with which He was bound to the scourging pillar. In a word, after the human race, aided by tradition, has for eighteen centuries been conjuring up to itself the physical appearance of Jesus of Nazareth, the photograph of the sacred shroud has given forth His portrait. The rumour of the marvellous event, mingled with trepidation, doubt, hope, and wonder, spread like wildfire in Turin. His Grace the Archbishop, Duchess Isabella, Princess Clara, illustrious prelates, artists, and business men hastened to the studio of Signor Pia to investigate the truth of the rumour. They were one and all convinced. A noted archaeologist and artist, who had previously expressed doubts as to the authenticity of the shroud, was now forced to exclaim: 'Either this is the true shroud, or it is a god who has painted it.' To understand how it is that the photographic plate renders the figure of the Saviour with a perfection that is not observed when the shroud is examined with the eye, it must be noted that the shroud bears the negative of the Saviour's body. The plate gives the negative of this negative, that is, the positive of Christ's appearance. It follows, however, that the printing of the photograph from the plate on paper gives once more the negative of the body, and accordingly the detailed portrait of our Redeemer is visible only on the plate. This plate will within a few days be placed for view in the Sacred Art section of the Turin Exhibition. Reproductions of it will be issued at the end of the month. The artistic property is reserved to the Crown, and all copies will bear the stamp of a committee specially appointed for the purpose."

ALTERATIONS which have been in contemplation for over thirty years have been commenced at Shrewsbury Station, and will involve an expenditure by the joint railway companies of something like £300,000. At the Birmingham end of the station the viaduct which crosses the Severn is to be widened to three times what it is at present, for what is practically a new bridge will be erected on either side of the present structure. In the centre of the river will be a pier of cylinders, from which will run a one-span arch to each bank of 100ft. between the piers. For this work the Cleveland Iron Company have entered into a contract for about £160,000, which includes other extensions at the same end of the station. At the other end, where the Chester and Crewe lines branch off, there will also be extensive improvements. The bridge, which at present crosses Castle Foregate, is 80ft. wide, and its width will be increased to 217ft., but there will be an open space for affording light for street traffic. A number of shops and private houses are to be demolished. One street (Cross Street) will be covered by another widened bridge, and Howard Street will be "moved" lower down the Foregate, and the gradients improved. These alterations will necessitate many minor ones, and a few years hence, for the work must necessarily occupy a considerable time, Shrewsbury Station will be double its present dimensions, and may be fairly expected to meet the requirements of an important railway centre.

SPAIN: Its Picturesque Cities and Monasteries.

III.—TARRAGONA.

By F. HAMILTON JACKSON.

(Continued from page 348.)

THE greatest historical interest of Tarragona Cathedral consists in its being the resting-place of the ashes of several of the mighty kings and queens of Aragon, which were removed hither from Poblet after the destruction of that monastery. Here, in particular, in a tomb forming part of the *trascoro*, itself brought from Poblet, rests the body of Don Jaime, *El Conquistador*, the great hero of Catalonia, who died in 1276. He it was who conquered from the Moors Valencia, Murcia, Majorca, &c. He it was who established the municipal body of Barcelona, called the Council of the Hundred, and he was one of the first sovereigns of Europe to establish a standing army. He was on his way to Poblet to become a monk, when he died at Valencia. On his death-bed he confided his good sword, "*La Tizona*, his dearest jewel!" to Don Pedro, in whose favour he had abdicated that same year at Alcera.

In 1836 the revolutionists destroyed the royal sepulchres at Poblet, which had been only damaged by Suchet, and cast their contents to the winds. A parish priest, whose church was near, piously collected them, and gave them shelter in his church for some years, and in 1853 they were removed to Tarragona, most of them to be reinterred in the cloister, the mummy of Don Jaime, which was wrapped in lead, with pieces of glass inserted, through which the body could be seen, being placed in the tomb already mentioned.

The chapter possesses a remarkably fine series of Flemish tapestries, dating from the fifteenth to the seventeenth centuries. They are used to decorate the piers and *rascoro* at high festivals, and it is worth while to so arrange a projected visit to Tarragona as to time it during the octave of one of the great festivals, for the purpose of seeing them.

The cloisters—a drawing of which is reproduced in the Supplement—are among the most beautiful in Spain, and are most interesting both in style and detail. The entrance door from the north transept of the cathedral is purely Romanesque, the tympanum filled with a

TARRAGONA CATHEDRAL: RIGHT HAND JAMB OF CENTRAL WESTERN DOORWAY.

TARRAGONA CATHEDRAL: GREAT WEST DOOR.

relief of Christ in Glory, with the symbols of the evangelists around, above a central pillar, the capital of which is carved with the adoration of the kings and other subjects. It rests upon a square base, surrounded with intertwined serpents, and the sacristan tells you that this came from a temple of Æsculapius. The range of little columns in the jamb has most beautifully carved capitals, showing, among other things, the three kings of the East sleeping in one bed, to whom an angel appears in vision. But all the capitals and abaci in this wonderful cloister are beautifully carved, either with figure subjects, ornament, or grotesques, such as the celebrated funeral of the cat, carried to its grave by the mice, who suffer for their charity. There are six large pointed arches in each walk of the cloister, beneath each of which are three smaller round arches, which rest upon twin columns. Above these lower arches the wall surface is pierced by two circular openings, which were filled with plate tracery of Moorish character. Many of these were destroyed by the French, but when they were all complete the effect must have been even more charming than it is now. The canons live in dwellings which open on the terrace above the cloister walk, and there is some good iron work there in a well-head. In the wall below are encrusted fragments of Roman sculpture, sepulchral inscriptions, and the Moorish arch of a small Mihrab or oratory—this dates from the year 960. Another inscription on the wall, "8th Company," is a memorial of the passage of some English cavalry who were billeted here. The centre of the cloister is occupied by a charming garden with fountains and marble seats made out of Roman remains. Palms and other tropical plants mingle with the flowering shrubs of more temperate climes, and the bay and the olive combine to make the place delightful with their shapely foliage.

Outside the cathedral, on the south side, is a little plaza planted with slim trees, beneath which picturesque market women sit with their wares in the early morning, but the principal market is held below the cathedral steps, where all sorts of produce are sold, fish, vegetables, fruit, old clothes, tin ware, &c.; a bewildering confusion of colour beneath striped awnings, themselves often gay enough in the sunlight, a confusion of flashing eyes and fluttering hands as bargains are struck, a

TARRAGONA CATHEDRAL: SOUTH-WEST DOOR.

confusion of laughter and clattering tongues, of old jokes and keen bargaining, mingling in one distracting whirl of busy life. Further away, to the east of the cathedral, is the Church of St. Tecla la Vieja, a Romanesque building of the twelfth century, which contains some curious, rather early tombs, which are quite Italian in feeling. They are in the form of small sarcophagi, almost like coffers, indeed, which are supported by two brackets some way up the wall, and are carved and gilded, and coloured somewhat like the reliefs in the chapel to the left of the entrance in S. Pietro in Vincoli, Rome. The plan of the church is a small nave and a chapel transept like, to the right of the altar, no aisles nor columns about it. Most of the tombs are collected in the chapel. The door of this church was probably the model imitated by Archbishop Gonzalez when sheathing the doors at the west end of the cathedral. The windows of the cloisters are protected by iron grilles having the symbol of the cathedral, a tau cross, intertwined with the hammered foliage, and facing this back part is the fine new seminary, in the courtyard of which is preserved yet another twelfth century church dedicated to St. Paul. To the north of the cloisters is the Quartel del Patriarca, the Archbishop's Palace, formed out of a Roman edifice, which contains one of the ancient towers within its precincts, and from here is a steep descent towards the Plaza San Domingo, which skirts the ancient wall of the city, and gives every opportunity of examining the different kinds of masonry used in it. In the Plaza San Domingo is a half-ruined building composed of work of various dates, and said to have been a palace, which is picturesque.

Outside the Puerta Rosario for some distance, both ways, the walls may be studied, the view being unobstructed by buildings. From this point the prospect is very fine, reaching to the finely shaped mountains which turn the Ebro towards Tortosa, across miles of a level and fertile plain called the Campo de Tarragona, where vines and nut trees grow luxuriantly, with the shore of the blue Mediterranean curving away towards the left. Below on the right is a little aqueduct made by one of the archbishops, which stretches from the nearest hill to the Plaza de Armas, where the garrison exercises below the walls of the Archbishop's Palace. There is a more important aqueduct of Roman work a league away along the road to Lérida. It consists of two rows of arches, the lower of eleven, and that above of twenty-five; its large square stones are put together without mortar, like many other Roman aqueducts. It is now ruined, but originally carried the water of the Gayá from Pont de Armentara twenty-miles away, partly above and partly under ground. It stands picturesquely in a small valley, amid fan-like palmetto, wild thyme, and sweet-scented rosemary, rising 90ft. above them. It is called, of course, "El Puente del Diablo," the common folk generally ascribing any wonderful work to his Satanic Majesty! There is another bridge, at Martorell, not far away, known by the same name, which consists of one enormous pointed arch, 133ft. wide, rising high above the river Llobregat, with a little chapel perched on the apex, a work which perhaps still more affects the imagination. It is, of course, Moorish, though an inscription states that its builder was Hannibal! The lower part of the town is

grouped around the port, and while it affords a busy scene of commerce, has little interest from the point of view of Art or Archæology, though I believe that the pier is built of materials taken from the Roman amphitheatre, and occupies the same site as a very ancient one.

An interesting excursion may be made to the monument known as the "Torre de los Escipiones," which lies about a league away towards Barcelona. It is reported to be the grave of the Scipios, but their real burial place is unknown. This monument lies close to the road, amid aromatic shrubs. Upon a large base, it rises to a height of about 30ft., formed of huge boulders. On the side next the sea are two figures, each raised upon a small pedestal, their heads resting on their hands, and their countenances expressive of grief. The stonework is much corroded. An alabaster inscription was taken from here by Cardinal Ximenez—in that which remains one word only is legible, and that word is "perpetuo!" The view of Tarragona from this point is charming; the city slopes down towards the mole, and on the left lies the Mediterranean, studded with white sails, while the distant hills appear through the network made by the red pine branches, and glitter through the dark velvet of their green and tufted heads. It is the place of all others from which to say "farewell" to Tarragona.

(To be continued.)

A THAMES EMBANKMENT SCHEME.

THE Improvements Committee of the London County Council, having considered a scheme for the embankment of the Thames from the Victoria Tower Garden, Westminster, to Lambeth Bridge, and the widening of Millbank Street, have issued a report on the progress made, but do not at present recommend the adoption of any particular scheme. They state that they had proceeded on the assumption that the present direction of Millbank Street would be maintained, that the street would join Horseferry Road at the present point, and that all the houses and wharves east of Millbank Street would be removed and the existing gardens to the south of the Houses of Parliament extended to Lambeth Bridge. If such a scheme were undertaken, Millbank Street being increased to 60ft., the estimated cost of the necessary property, after deducting recompent, would be £601,500, and the cost of the embankment and making up roads £41,000, making a total of £642,500. If, in lieu of laying out the land to the east of the street as a garden, the site should be let on building leases—the new buildings to have a frontage to the river and a road between them and the river—the recompent would be enormously greater, and the estimated net cost of the scheme more than £71,900. The cost to the Council of laying out as a garden the land to the east of Millbank Street, which would be about four acres, would be £570,600. While recognising the importance of such an improvement in throwing open Millbank Street to the river and extending the public garden, they felt that, having regard to the other public improvements required in all parts of London, the outlay of £570,600 on the acquisition of about four acres of garden could not be justified unless Parliament was prepared to make a large contribution towards the cost, in view of the importance of improving the access to the Houses of Parliament from the south and of removing further from them the buildings in Millbank Street. During the consideration of the matter, the chairman (Mr. Shaw Lefevre) had suggested that the cost of the scheme might be considerably reduced by altering somewhat the line of Abingdon Street and Millbank Street by commencing Abingdon Street at an angle from Old Palace Yard and continuing thence in a direct course to the abutment of the new Lambeth Bridge. By that means a great improvement to the access to the Victoria Tower of the Houses of Parliament would be effected, and the claim for a contribution by Parliament towards the expense of the scheme strengthened.

POETRY IN ARCHITECTURE.

BY GEORGE AITCHISON, R.A.

PROFESSOR GEORGE AITCHISON, R.A., delivered a very interesting address on the occasion, on Monday week, of the presentation to him of Her Majesty's gold medal for the promotion of Architecture. The presentation, as reported in our last issue, was made by Mr. F. C. Penrose, F.R.S., at the last ordinary general meeting of the Royal Institute of British Architects. In acknowledging the honour, Mr. Aitchison said, after returning thanks:—The most cherished desire I have is to see English Architecture come to the forefront, and

ERECT MASTERPIECES IN ENGLAND

which can epitomise the grand thoughts of the day, and give them a character which will attract mankind. When I look at Salisbury, at York, at Peterborough, at Durham, and at Lincoln, I cannot think that they fall greatly below the most renowned cathedrals of Europe, I cannot believe that the nation that has given us the steam-engine, the railway, the telegraph, the steamboat, and all the triumphs of iron; that has given us Darwin, Tyndall, Huxley, and Herbert Spencer; Parkes, Simpson, and Lister; Turner, Leighton, and Millais; Wordsworth, Browning, Tennyson, and Swinburne, can have sunk so much below the standard of our semibarbarous forefathers of the thirteenth century as to be incapable of developing the Architecture we have into a true presentment of the highest aspiration of the nation and the ideal beauty of our time. No, it is that we have got into a wrong groove, and we must get out of it before Architecture ever again becomes a progressive Art, and can equal or surpass the glorious masterpieces of the past. The Renaissance men got Architecture out of the way of progress by casting themselves at

THE FEET OF THE ROMANS,

and proclaiming that Roman Architecture was perfection, and could not be surpassed, although they did some noble and some beautiful work; ever since all the architects of Christendom have only attempted to paraphrase some deceased Architecture. No one can deny that Architecture is the poetry of arrangement and construction, and we must have these at our finger ends before we can hope to progress, so that when the heaven-born genius comes he will have his tools ready. Genius to us is a causeless sport, to use the breeders' term, but, looking at its paramount importance to mankind, one would think it is of more importance for them to study the law of it than it is to improve the breed of racehorses or of sporting dogs. You are not to think that arrangement and construction alone will give us all we want, or else the marvellous works in iron of the engineers would have given it us. We have to study

THE METHOD OF EXPRESSION

that the masters of our Art have employed, to learn how we may express our thoughts in our own climate; and we have both to study and to strive, for that is the foundation of all improvement. We must, too, of necessity have change and novelty; different times, different surroundings, and different circumstances beget a different frame of mind. We cannot suppose that the delight at the lark's song affected the Greeks, the Romans, the mediævals, and people of the Renaissance exactly in the same way as it affects Englishmen of the nineteenth century. Homer and the Greek dramatists, Virgil and Horace, Dante and Chaucer were possibly poets superior to our own, but they do not come home to us like those of our own day. The loves and misfortunes of the past do not touch us as those of the present, and few of us can weep over the misfortunes of Hecuba, Iphigenia, Antigone and Dido. Our own poets, whom we look on as the greatest, Shakespeare and Milton, do not touch the inmost strings of our hearts like the poets of yesterday or to-day. Walter Scott saw that, and said the surrounding may be of any time you like, but the heroes and

heroines must be of to-day, or no one will take an interest in them. Our revivals of Classic, Gothic, or Renaissance may be very clever and very good, but no one of them ever caused the same emotion in us as it did in the people of its day. I know you will say people did care for Architecture in those days, and they do not now; but while there are buildings to be erected it depends mostly on the architect whether they are to be true and good, for he can always refuse to erect that which he feels is not true or not proper. I feel sure that there must be structural poets among that vast army of architects with which the country is now furnished, and though I feel it is rather an impertinence to suggest what a poet should do, I cannot help feeling that there are vast fields in England still untouched. One of the greatest merits of Athenian Architecture is that it takes the utmost advantage of the clear air and brilliant sunshine both in the main structure of its buildings and also in its mouldings; and, mind you, the materials are marble. We, since Gothic times, have never taken the slightest trouble with our mouldings, to make them tell their tale in the damp and dulness of our climate, and when one considers that Architecture has been defined as the art of moulding, this alone offers a large field. Another field, not altogether so untouched as moulding, is proportion, and that field is infinite. And here I speak of the infinity of good proportion, for there is a still greater infinity of bad ones. In a handful of flowering grasses, each one will give you a different and elegant proportion, and at least for iron we need not be confined to the classic proportions perfected by Vignola and Palladio. We have scarcely tried to bring cast-iron within the pale of Architecture,

although it has a capacity for almost every form, and is open to the magnificence of enamel. In fact, colour is almost untried, and, seeing the dust and soot of large manufacturing towns, it would add to their healthfulness, as well as to the raising of our spirits, if, in our damp and depressing climate, the fronts of our buildings ceased to be of dingy brick, and were

RESPLENDENT WITH GORGEOUS COLOUR,

and gleamed with gold. I know that there is a prejudice against the use of coloured and enamelled pottery (ironically called buildings of crockery), but since Nature has coloured all her work we need not be ashamed of doing so, and the gorgeous and monumental decoration of Darius's Palace at Susa should help to dispel this misconception. Let us hope that our new structural poets may give us a beauty and magnificence hitherto undreamt of; and that Architecture may again captivate the public, and be the boast and pride of the coming century. — The ceremony was concluded by a few felicitous sentences, uttered by Dr. Murray of the British Museum. He knew Mr. Aitchison, he said, as a friend to whom classical Architecture was dearer than it was to any man he had ever met. Mr. Aitchison had rendered good service to the British Museum in the reparation of pieces of ancient Greek Architecture which had come down to us, and it was always a great joy to the speaker, when in any difficulty, to have the ready and warm assistance of the President of the Royal Institute of British Architects. — The walls of the Council Room were lined with Mr. Aitchison's drawings, which showed how well-merited is this latest honour.

TARRAGONA CATHEDRAL: THE CLOISTER DOOR.

ROMANESQUE ARCADE BUILT INTO A HOUSE IN TARRAGONA.

Church Decoration in Ireland.

A RECENT ADVANCE.

A NEW church at Bray has just been completed. The interior decorations of the church introduce some features which are entirely new in Ireland. The edifice is in the later Romanesque style, when it was giving way to the Gothic and borrowing something from the lightness of the pointed style; it possesses more elegance and grace than are usually found in buildings in the Romanesque. Its ornamentation is handsome and appropriate, and in the richness of its material it is not surpassed. Even in its incomplete state the church presents an appearance of considerable magnificence. The height and proportion of the chancel arch, as seen from the front entrance, is very impressive, and its decorations produce a very striking effect. Not less impressive are

THE TRANSEPT ARCHES

opening into the nave. These are double arches resting on cylindrical shafts of polished red granite. The strength of the supporting column will be understood when it is stated that it is a monolith 14ft. in height by 2ft. in diameter. An unusual effect is here introduced. The central supporting shaft is accompanied by two slender columns, one on each side, which appear to support the heavy mouldings of the arch. These give an effect of lightness that is very uncommon. The Corinthian capitals are exquisitely carved. These are of bathstone, as are the moulded bases. The arches are richly moulded. There are six stained glass windows in the apse, lofty and with rounded heads and moulded arches. Each transept is lighted by a pair of similar windows filled with cathedral glass, and the side chapels have stained glass windows. The roof of the church is in pitch pine panelled. The chancel and passages will be laid in mosaic on a concrete bed, and the flooring under the seats will be in pitch pine. The walls of the chancel will be panelled, and the panels divided by green and black veined marble, pilasters will be filled with different coloured Italian marbles. The seven panels in the roof of the apse are filled with

OIL PAINTINGS ON CANVAS.

The painting on the centre panel is a figure of the Redeemer, and the six panels at the sides

contain figures of angels bearing musical instruments, each picture symbolising some particular feature in our Lord's life. The paintings are very fine, and bear close examination. The roof panels in the side chapels will be similarly filled with canvasses. The chancel arch and the spandrels of the side arches in the choir, as well as the spaces between the windows of the apse, are decorated in distemper. There is nothing like this in Irish churches, decorations of the kind having been invariably done in stencil work. It is done on what is technically known as "black and white," but to the ordinary observer it appears to be in chocolate lines on a gold ground. The effects of chiaroscuro are remarkably good, giving depth, roundness, and space. This is especially the case in the figures of Saints Patrick and Kevin, on the sides of the chancel arch, which stand out in such strong relief that most visitors who saw them believed them to be statues. The light and shade is very well managed. All

THE DECORATIVE WORK,

the oil paintings, and the distemper, was done by Signor Eduardo Buccini, a Neapolitan. He designed and executed the work himself. The church was designed by Mr. W. H. Byrne, architect, Suffolk Street, Dublin, and the building is being carried out by Messrs. Michael Meade and Son, Great Brunswick Street, Dublin; the marble work was divided among three Dublin firms. The high altar, by Mr. Early, of Camden Street, is in course of erection; it will be in keeping with the character of the church, and will be surmounted by a massive canopy or baldachino. The altars of the side chapels and the two smaller altars are in course of erection by Mr. Sharpe, of Great Brunswick Street. Mr. Pierce, of Great Brunswick Street, has the altar rails almost completed. The same firm is sheeting the panels in the apse walls with coloured marbles. The mosaic in the floor and passages is being put down by the firm of Oppenheimer, and the stained glass was supplied by Mayers, of Munich. The carving of the capitals already referred to was executed by Mr. De Groot, Dublin. The cost of the work up to the present is £17,000.

GREAT ART WORKERS OF THE CENTURIES.

LUCCA DELLA ROBBIA: ARTIST IN BAKED CLAY.

CLAY appears to have been one of the very earliest substances which humanity attempted to turn to artistic purposes. The remains of the *pfahlbauten*, or wooden dwellings of the prehistoric man, as dredged up from the mud of the Swiss lakes, reveal specimens of rudely-carved wood and bone, and of pottery quite as rude. The latter, chiefly pots or jars, are only approximately circular, having evidently been formed by hand, before the invention of the potter's wheel, which was known to the ancient Egyptians. But rude as they are, they are not devoid of a crude ornamentation. Portions of their surface are found to be covered with simple ornamentation of a "repeat" character, probably produced by puncturing the surface, while still plastic, with the end of a pointed stick. Later on, and coming down to the historic period, the researches of Botta and Layard reveal that the Chaldeans and Assyrians impressed letters of a wedge shape on tablets of clay, which formed the books of the period. The potter's wheel would appear to be a later invention, but as this is applied solely to the production of porcelain and pottery for domestic use, and not to the fashioning of clay into statuary or other terra-cotta work, we may pass it without further notice. The surface of baked clay is, of course, rather rough and mostly somewhat dingy in hue, while it is also very porous. To obviate these drawbacks there is but little doubt that the application of some kind of vitreous glaze was very early resorted to, and, as might have been expected, numerous fragments testify to the use of

ENAMELS AMONGST THE EGYPTIANS AND ASSYRIANS,

and glazing among the ancient Greeks and Romans. After the fall of the Roman Empire, the art of dealing with clay in the formation of pottery appears to have been lost for a season. It was, however, revived by the Mohammedan invaders of Spain, whose tiles of enamelled earthenware are to be seen in the Saracenic buildings of Seville, Toledo, Granada, and the Alhambra. The Spaniards subsequently acquired from their Moorish invaders the art of manufacturing enamelled tiles. This Hispano-Arabic ware is the prototype of the Italian "majolica," the enamelled ware of Italy, which dates from the twelfth century. This pottery was called majolica, from the island of Majorca, one of the Balearic isles, situated in

TARRAGONA: PHOENICIAN TOWER, FROM OUTSIDE THE WALLS.

the Mediterranean, not far from the coast of Spain, where it is supposed that enamelled earthenware was made at a very early date. In connection with this the following tradition is extant:—It is related that a pirate king or chief of Majorca, about the year 1115, was besieged in his stronghold by an army from Pisa, and being vanquished, the expedition returned to Italy laden with spoil, among which were a number of plates of Moorish pottery. These were, however, not imitated by the Italians until the fourteenth century, when specimens of majolica—so called from the country from which the pattern plates had been brought—were produced. These Italian examples resembled the Moorish ones in having arabesque patterns in yellow and green on a blue ground. About the year 1451 the manufacture had become celebrated at Pesaro, the birthplace of Lucca Della Robbia, the subject of this brief sketch, who has been

REGARDED AS THE INVENTOR

of this ware, although, as a matter of fact, it was made at Pesaro long anterior to his birth. The distinction which should be made, but which is often overlooked, is that the majolica is simply glazed earthenware suited for domestic purposes of either utility or ornament, but "Della Robbia" ware is glazed earthenware adapted for architectural decoration, especially external. But there are other points of distinction beside these. The Early Italian pottery has its surface embellished with patterns and designs in colours, but no relief effects are aimed at or secured. But, on the other hand, the examples of glazed terracotta of Della Robbia are generally in relief, more or less high, and consist very frequently of figures "in the round," or entirely detached from and independent of any background. In this respect these works have a greater resemblance to Palissy ware than to majolica, seeing that the former affects figures in high relief. Ordinary terra-cotta (or baked clay) has been a favourite architectural material in Italy for centuries before the birth of Della Robbia. This liking for brickwork was probably inherited from the Romans, as the Gothic race: of the north despised brickwork, and built cathedral and castle alike in stern grey stone. This more ancient Italian terra-cotta simply consisted in moulding brick earth into shapes somewhat more ornamental than that of the ordinary parallel or grammatic brick, and baking or burning it, clay being selected which would produce various lines or rather tints when burned. Concerning this earlier terra-cotta Architecture of Italy, which is considerable, the curious reader may learn everything from the exhaustive work of Leopold Gruner, of which an English translation has been issued. The merit of Della Robbia is, first, that he gave to the clay much

MORE ORNAMENTAL AND DECORATIVE FORMS

than any of his predecessors had dared to do, even to the extent, as we have previously remarked, of executing statuary in it, and, secondly, that he covered his works with a stanniferous or vitreous glaze of the brightest hues, an addition which, in regard to architectural terra-cotta, had previously only been utilised for the surface of tiles. Lucca Della Robbia may fairly be considered one of the Renaissance artists of Italy, seeing that, although the date of his birth is not exactly known, he flourished during the *cinque cento*, dying in 1481. He appears to have been an enthusiastic worker, as examples of all descriptions, in the glazed and coloured ware which bear his name, are numerous. After the death of Lucca Della Robbia, his nephew and pupil, Andrea Della Robbia, carried on the manufacture, his works being little, if any, inferior to that of his illustrious predecessor. Ware of this description has been more or less successfully produced recently by certain Italian, French, and English potters. Much of this consist of adaptations rather than direct imitations of the old methods; modern designs and modern forms being in many cases adapted with success. Cavallucci and Molinier observe in the commencement of their fine monograph on this great artist: "By the side of the three greatest sculptors of the first half of the fifteenth century—by the side

of Lorenzo Ghiberti, of Donatello, and of Jacopo Della Quercia, another artist merits a place. This artist is Lucca Della Robbia." Let us now glance very briefly at the main facts of

THE GREAT SCULPTOR'S LIFE.

He was born in the year 1388, it is supposed in the ancestral mansion of the Della Robbia, not far from the Church of St. Barnabas, at Florence. Like so many of the great Italian artists of the Renaissance period, Lucca Della Robbia was placed with a goldsmith to learn that business. But the boy's natural appetencies towards a higher range of art were too strong to be controlled. Beginning by modelling figures in wax, he soon became ambitious of rendering them in durable bronze or marble, and hence relinquished goldsmith's work for sculpture. Baldinucci tells us that his master in that new *métier* was no less a man than the famous sculptor, Lorenzo Ghiberti; but, however this may be, young Lucca Della Robbia made rapid progress in his new profession. He had scarcely attained the age of fifteen years when he was conducted, with some other young sculptors, to Rimini, in order to execute some figures and monuments for Sigismund Malatesta, lord of that city, who desired to erect in the Church of St. Francis a mortuary chapel to his lately deceased wife's memory. Lucca Della Robbia's next work (in marble) was for the Church of St. Mary of Flowers, at Florence. Soon after this he began to produce statuary in the enamelled terra-cotta to which his name has been attached, and did much work for the various members of the great Medici family. He died in 1480, at the age of ninety-two years. After the decease of Lucca Della Robbia the style of art which he had founded was, as we have mentioned, carried on by his nephew, as also by his brothers, Octavian and Augustine. The extant works of this great artist are numerous. As was to be expected, Italy—especially Florence—possesses

THE GREATEST NUMBER OF EXAMPLES.

But there are many in France, and even in our own country Lucca Della Robbia is by no means inadequately represented, as we shall presently see. As a general rule, the human figure forms the principal object in his designs, generally in high relief or the "round." Still, borders of fruits and flowers, canopies, draperies, &c., in the style of the *cinque cento*, are freely added as adjuncts. Lucca Della Robbia treats the human form divine with the freedom and grace which might have been expected from a sculptor. A certain excusable hardness, perhaps, characterise his earlier efforts, as is evinced in a figure of Christ on a *bas relief* on a tomb of Benozzo Federighi. Subsequently the mode of treatment became much more free, as is to be seen in the well-known Madonna and Child from an altar-piece, wherein a fruit border-canopy is introduced, and a replica of which is to be seen at South Kensington Museum. In the same place the visitor will find some excellent and characteristic specimens of the work both of the subject of this sketch and of his nephew Andrea, who both in artistic faculty and in technical execution was little his uncle's inferior, if any. Here will be found twelve circular medallions of enamelled terra-cotta, painted in blue, with representations of the agricultural operations of the year and with the

SIGNS OF THE ZODIAC,

which are considered to be by the hand of Lucca, and are conjectured to have formed part of the interior decorations of the writing cabinet of the famous Cosmo de Medici. An altar-piece representing the Annunciation, in high relief, of white enamel, without the addition of colour, but showing some tracing of gilding, is also there; as also a very important specimen, an altar-piece representing the Adoration of the Magi, and containing upwards of twenty figures, many of which are believed to be portraits of contemporaries of the sculptor. Some attribute this to Lucca, but it is more probably by Andrea, while in his uncle's employ. A very grandiose and imposing specimen is fixed against the wall in

the north arcade of the museum. This is a medallion, 11ft. in diameter, bearing the arms and emblems of King René of Anjou, father of Margaret, the wife of our Henry VI. It is believed that this was executed about the year 1543, being, of course, executed by the nephew Andrea, and was fixed at a considerable elevation on the external wall of a villa near Florence, in memory of a visit from the king. It was only a few years since removed from its original position, having, therefore, endured the action of the atmosphere for more than 400 years. We wonder how it would have fared in London! Another very beautiful example at the Museum is a full-length figure of the Virgin with the infant Saviour in her lap, under a border of fruit and flowers, attributed to Andrea by many. In the Chapel of the Medicis (or of the Novitiate) will be found a group, in which the Virgin is seen seated upon a throne, holding upon her knees the infant Saviour in the attitude of Benediction. Two angels hold a crown over the head of the Virgin. On the sides of the throne are St. John the Baptist, St. Lawrence, St. Francis, and St. Anthony of Padua, with two other figures of saints in *bas relief*. The pilasters which flank the composition are ornamented with handsome candelabra, and the frieze which surmounts it bears the heads of cherubs. On the base is an inscription. The work, which is a pleasing composition, is in white enamel on a blue background. It is generally considered to be the work of an artist of the school of Andrea Della Robbia, but whose ever it is, it is worthy to rank among the finest specimens, both for artistic composition and technical detail.

W. N. B.

THE new temperance hotel which has been built in Clayton Street, Newcastle, was recently opened. The building was designed by Messrs. Oliver and Leeson, and built by Messrs. J. and W. Lowery.

MR. A. E. SANDFORD FAWCETT, Local Government Board inspector, recently visited Mirfield to hold an inquiry respecting the Council's application to borrow £5800 for purposes of sewage and sewage disposal.

In the review of Bell's Cathedral series, which appeared in our last issue, the writer is made to say, in reference to Hereford: "Judging from the illustrations and speaking from personal memory, this tower is certainly not decorated, and its date is more probably 1300-1315." It should have read: "this tower is certainly decorated"—the point being that it could not very well be of the decorated period and at the same time be built in 1200-1215, as given in the book. As it appears to be of the decorative period, its date would more probably be 1300-1315. In the next line the word "perfect" should have been *profuse*.

In the case of John Good v. Corporation of Dublin, the plaintiff, who is a builder and contractor, claims £24691 4s. 3d., balance alleged to be due in respect of contracts for works executed in connection with alterations and improvements in Green Street, Court House, Dublin, and for extras and additional works, as well as for materials supplied for the defendant's use. There was also a plea of breach of contract. The plaintiff's case was that he carried out the works contracted for originally on the 15th February, 1893, with certain extra works incidental thereto, to the satisfaction of the city architect, the value of the work amounting to £2090. During the progress of the works the city architect ordered him (plaintiff) to make additions and variations and to execute extra works outside those specified in the original contract, the value of which was set down as £2629 14s. 3d., which, added to the £2090, made the total £4719 14s. 0d. Plaintiff received £2250, and he now sued for the balance.—The defendants brought into court £960 as full satisfaction for plaintiff's claim. They alleged that all alterations, deductions, and additions to the work provided for under that contract were to be valued according to the schedule of prices agreed upon, and that after a survey and valuation by the city architect, it was found that in addition to the amount already paid, the balance due amounted to £954 11s. 5d.—The case is at hearing.

A NEW BIRMINGHAM HOTEL.

FAMOUS COACHING INN DEMOLISHED.

WITHIN the last few months there has risen in Birmingham a terra-cotta building, whose style and proportions must have impressed all who have passed within sight of it. The building occupies the site of the old coaching inn bearing the title of the Hen and Chickens, which title has been given to the new hotel. The rest of the site, the portion formerly occupied by the stabling and coachyard, has been taken up by the Girls' High School of King Edward's Foundation, and the new hotel building—which is on ground leased from the governors—has been designed to form with the school building one harmonious pile. The building, which, with its equipment, has cost £20,000, is one of the loftiest in New Street, rising 60ft. above the street level, while the floor of the sub-basement is 25ft. below. The site has a frontage of 48ft. and a depth of 50ft., with an extension of 15ft. under the school premises for the sub-basement. The building rises to a height of five stories and a mansard. The architect (Mr. J. A. Chatwin) has not only made the most of the space at his disposal from a business point of view, but he has made a sterling addition to the architectural attractions of the city. The material, red terra-cotta, suggested Renaissance ornateness of treatment, but the details are so

FULL OF THE GOTHIC SPIRIT

—being, in fact, a development of the Tudor Architecture, the latest Gothic, of which the boys' school is so admirable a reproduction—that the two buildings viewed together present at once a harmony which suggests kinship and a contrast—aided by the difference in colour—which averts comparison. Between the two is the porch giving access to the girls' school; and an open space 30ft. in width above this allows a portion of the latter, designed by the same architect, to come into the general view of the hotel from this, the west, side. The porch of the girls' school is thrown back about 19ft., and the clear corner thus formed has given scope for a handsome feature of the hotel—an octagonal corner tower. This tower, which rises from the level of the first floor on a splayed pier of polished Aberdeen granite, is broken by a series of oriel windows, and is surmounted by a short but graceful spire. The upper portion of the façade towards the street is broken by a central series of projecting oriel windows, terminating with a decorative gable in front of the high-pitched roof. On the first three floors, towards both New Street and the boys' school, are bay windows. The rest of the windows and the parapet are of ornate design, with Gothic mouldings. The first story is faced with Aberdeen granite. The portion on the right of the principal entrance has a shop window frontage, and that on the left, which has been more quietly treated, has been taken as an extension of the bank premises.

A HANDSOME ARCHWAY AND VESTIBULE give access to the hotel and to the café, the latter in the basement. The hotel proper, entered through a lounge behind the vestibule, commences on the first floor, where, facing New Street, are the commercial-room and the drawing-room, partitioned by screens of glass and polished mahogany. Behind is the coffee-room, while further back are a smoke-room, serving-room, and lavatories, a centrally-situated office completing the suite on this floor; the second, third, and fourth floors containing the visitors' bedrooms, forty-eight in all, and each containing a fireplace. In the mansard are sitting-rooms and dormitories for the staff. The lighting of the hotel is a remarkable feature. The building is so far detached from its surroundings that from the first floor upwards three and a half sides have light and air space, while further lighting is afforded by an oblong wellhole, extending from the third floor to the roof. The result is that there is not a dark corner in the hotel. The oriel rooms, formed partly in the tower, are particularly pretty. In the rear, towards

the bank, is the main staircase, which is of granite, with a handsome wrought-iron balustrade, and is lighted by

WINDOWS OF CATHEDRAL GLASS.

The flats formed behind the roof-parapet towards New Street and the boys' school afford most extensive and interesting views, the greater portion of the city in three directions being spread out as a map before one. In the well is a passenger-lift traversing the nine stories of the building, and available for conveying visitors' cycles to a store provided for them in the basement. The hotel is not quite ready for occupation. The café in the basement was opened only a few days ago. It is approached from the vestibule by a wide staircase, the sides of which are filled in with bevelled glass. The basement extends partly under the footpath, from which it receives a considerable amount of light, the privilege of inserting these lights having been conceded by the Corporation in return for the surrender of the projecting porch of the old Hen and Chickens Hotel. The flight of stairs terminates near the wall towards the bank, and on the right is the smoke-room, occupying a rear corner of the basement and divided from the café by glass screens, the rest of the basement being occupied by tables. The floor is of ceramic mosaic. The white ceiling of enamelled iron is divided into bold panels with dentile enrichments, and is supported by handsome columns of Ross of Mull granite. The café, though its floor is 14ft. below the street, is amply lighted by pavement prisms, the glazed staircase, and the rear windows, which look out upon a wide area. The walls are covered with glazed Minton tiles and the greater part of the surface is light-straw colour, with figured panels in cream, and narrow upright panels in light green. The decoration of the frieze and dado has the oak-leaf for its leading theme, and its colour scheme ranges from straw-colour to russet. The artificial lighting here, as throughout the hotel, is by electricity. The buffet communicates by means of lifts in the wall with the sub-basement. In this, with a floor-level 25ft. below the street, are the separate kitchens for the café and the hotel, rooms for the attendants, store-rooms, laundry, motor-rooms, and other service departments. Every part of the building is ventilated by means of exhaust-fans driven by electricity, which also supplies the power for working the lift, &c. The contrast between the new hotel and that from which its name is derived is very striking, although it is only in keeping with the advance in public taste and private enterprise, which has taken place during the present century; for the building which first occupied the site of

THE PRESENT PALATIAL STRUCTURE

was more commodious and comfortable than it was beautiful. Indeed, a less attractive house would have been hard to find than the hotel as it was in the year 1800. And yet at that time the Hen and Chickens was esteemed an excellent example of hotel Architecture, the enterprising lady who had built the place announcing, with pardonable pride, in *Aris's Gazette*, of March 26, 1798, that it had been "built according to the plans of James Wyett, Esq., of London," an architect, we fear, whose name has not otherwise been handed down to posterity. But in those days it is evident that less regard was paid to outward appearances than to internal comfort; for attention is particularly directed in the advertisement in question to the fact that "the interior of the house is fitted up and furnished in the best manner, the beds, in particular, being all new and of the best quality." After all, this was the first essential in a place of entertainment "for man and beast," and it is very apparent that, despite its severely plain and unattractive exterior, the Hen and Chickens soon became a favourite resort, the interior of the place containing attractions which the outside lacked.

The Lord Mayor of London recently visited the City of London Asylum at Stone, near Dartford, for the purpose of laying the foundation stone of a new church.

A YORKSHIRE CHURCH REBUILT.

THE Church of St. Mary at Sledmere has just been consecrated. With the exception of the old mediæval tower, the whole of the former church has been rebuilt, and even the old tower has been renovated almost beyond recognition. It now furnishes a fine example of the fourteenth century English-Gothic style of Architecture, and the stone and wood carving of the interior being of a most elaborate and costly character, the new church will rank as one of the finest of the many fine churches erected as a result of the generosity of Sir Tatton Sykes in the Yorkshire Wolds. The tower was the only

PART OF THE MEDIEVAL BUILDING

left when, about the middle of the last century, it unfortunately gave way to a plain structure of no artistic merit. When about sixty years ago Sir Tatton Sykes decided to rebuild the church, the lines of the original church were discovered during the removal of the Georgian building. It was then determined to erect the new church on the same ground plan as the mediæval one, retaining the fourteenth century tower. The new chapel consists of a nave of five bays, with north and south aisles and a spacious chancel. The vestries are on the north side of the chancel, with the organ chamber over the choir vestry. The proportions of the church internally are remarkably good, and for its size the interior is unusually impressive by reason of quiet and restrained dignity. The style adopted is that of the best type of fourteenth century English-Gothic. The lofty nave arcade has

RICHLI MOULDED COLUMNS AND ARCHES,

with moulded caps and bosses. The aisles are vaulted in stone, the cells of the groins being filled with clunch, and the ribs and bosses being in the red stone throughout the interior. Nave and chancel roofs are carried from west to east at one unbroken level, and are massively constructed of oak, while the ceilings are panelled in oak, with finely carved bosses at the intersections of the main timbers and ribs. On the windows, tracery of the earlier type of the Glowing Decorated has been used, the great east window being a fine design in five lights. The chancel windows, entirely filled as they are with fine stained glass, recall in the breadth and simplicity of their treatment some of the best examples of the art. At present the nave windows are only temporarily glazed, but it is Sir Tatton Sykes's intention to fill these with stained glass similar to that in the chancel.

A FEATURE OF THE CHURCH

is the fine stone reredos at the east end of the north aisle, rising nearly to the height of the vault; while even more noteworthy is the elaborately designed wood-carved reredos immediately above the high altar, representing the Crucifixion, with the Virgin and St. John and the Apostles on either side. In fact, the whole of the woodwork must be regarded, both in design and execution, as amongst the finest of modern examples. The altar frontals and hangings are of great beauty, and the floors of the church are of a softly tinted Irish marble. The tower has been carefully restored, and a parapet added to the original design. On the parapet are shields bearing the arms of families that have at different times been connected with the estate. The whole of the exterior of the church is executed in Whitby stone, and is remarkable for

ITS SIMPLICITY AND STATELINESS.

Mr. Temple Moore, of London, was the architect, and the whole of the work has been carried out under his supervision. The contractors for the work were Messrs. Thompson, of Peterborough, whose representatives have been Mr. Geo. Mills and Mr. J. Baker. The stained glass has been supplied by Mr. H. B. Milner, the frontals for the high altar and the hangings by Messrs. Watson and Co., the frontals for the side altar by the Horbury Sisters, and the metal work by Messrs. Hardman. The marble flooring is from the works of Mr. R. Collis, Kilkenny; and Messrs. Wise and Co., Leeds, constructed the organ.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
June 29th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slat; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

SOME time will yet elapse before the public can visit the old State Rooms at Kensington Palace. The officials of the Office of Works under Sir John Taylor have found more repair necessary than was anticipated. The floorings were in a rotten condition. All the beams have been carefully examined and new oak beams are being put in. Sir John Taylor, who is superintending the work, has just been appointed Consulting Surveyor to the Office of Works.

THE companionship between Sir Edward Burne-Jones and William Morris has not been broken for long. It was one of those ideal friendships between great men, formed in youth and maintained to the end. When the pressure of work and outside interests began to keep them out of the continual companionship of the days when they lived together, they made a compact that at least once a week they would keep a few hours sacred for one another. Every Sunday morning, accordingly, they reserved for this purpose; and always breakfasted together on that day, Morris walking over from his house at Hammersmith to his friend's house at Fulham. It was not until Morris's last illness, says the Westminster Gazette, that this custom was broken.

THE memorial to the late Suffragan Bishop of Coventry, Dr. Bowlby, which was unveiled last October at St. Philip's, Birmingham, took the form of a very handsome window designed by Sir Edward Burne-Jones. The distinguished painter was a native of Birmingham, and was born in a house almost under the shadow of St. Philip's Church. In the beautification of the sacred edifice he took great personal interest, and the church now possesses a complete set of windows designed by him. These represent "The Nativity," "The Crucifixion," "The Ascension," and last of all, "The Judgment Day." It is this latter which was dedicated as a memorial to Bishop Bowlby. The cost of the work was £770, and Sir Edward Burne-Jones, besides returning his cheque for £250 for the design, personally superintended its execution at Burton Abbey.

AN archaeological discovery of the highest interest has just been made at Tongres, province of Hasselt, where excavations in one of the tumuli at the intersection of two Roman roads have brought to light a sarcophagus containing the remains of a Roman artist of the third century. With the remains were found a large number of urns, vases, and miscellaneous trinkets; but perhaps the most interesting item were the bronze cups containing remains of the artists' colours, which will, it is hoped, throw some light on the process of contemporary painting.

NORRIS CASTLE, whose beautiful ivied towers are familiar to every yachtsman on the Solent, was recently offered for sale at the Mart, Tokenhouse Yard. The representative of Messrs. Walton and Lee, who were the auctioneers for the estate, observed at the opening of the sale that there were two kinds of estates: with regard to the first, any praise would be an exaggeration; and with regard to the second, no praise would be too great. He intimated that the second of these attributes appertained to Norris Castle, and he had been specially asked not to exercise his descriptive powers. These, nevertheless, appeared to be considerable; and he went at some length into the history and advantages of the beautiful old place, built last century by Lord Henry Seymour, and for some years the home of the Queen while she was Princess Victoria. But all his eloquence failed to extort a higher bid than £40,000, and the estate was withdrawn.

THE Church of St. Helena, Austerfield, to which we referred in a recent issue, was reopened some days ago, after a careful restoration from designs by Mr. Hodgson Fowler. Many objects of great antiquarian interest have been disclosed during the recent restoration. A memorial brass is shortly to be inserted in the new aisle in memory of William Bradford, who was a native of Austerfield. The brass will contain the following inscription: "This Aisle was built by the Society of Mayflower descendants and other Citizens of the United States of America in memory of Governor William Bradford, who was born at Austerfield, and baptised in this church on the 19th March, 1589. 'He was the first American citizen of the English race who bore rule by the free choice of his brethren.'" The date of the church is about 1130. With the exception of windows of the fourteenth century, and of the addition of the north aisle and a new vestry, the original Norman structure remains intact.

ACETYLENE gas, one of the latest products of practical science, is receiving the honour of an exhibition for its own special behoof at the Imperial Institute this season. The new gas, of which great things are anticipated, and, as far as can be seen, not unjustly, is said to have fifteen times the lighting capacity of coal gas, while it has the advantage over electric light of possessing greater penetrative powers in thick and foggy weather. Hitherto the progress made by the gas has been small, owing to the difficulties created by the deposit of carbon constantly accumulating on the burners and blocking up the orifice, causing the gas to smoke and vitiating the atmosphere. But this defect has now been overcome by the admixture of a small percentage of carbonic acid gas with the acetylene, which has produced a chemical change in the gas, and vastly improved the light. In its present state the gas is said to be, when burning, perfectly odourless, free from smoke, and devoid of heat. If allowed to escape it gives out a pungent, disagreeable smell, but this is rather an advantage, since it enables the householder to detect at once when there is anything wrong with his apparatus or fittings. In regard to cost, there are varying estimates, but it would appear that there is good ground for saying the illuminant is cheaper than coal gas if the amount of illuminating power is considered. Whether this will be entirely satisfactory to the householder is an open question. If he has been used to, say, a 16 candle-power light, he may not care to pay double or treble for a burner of even five or six times that capacity. The gas, however, has such unquestionable advantages that it cannot fail to make headway sooner or later.

ONCE again an exhibition of decorative hammered and repoussé work in silver, by Mr. Gilbert Marks, is being held at 80, Aldersgate Street by Messrs. Johnson, Walker, and Tolhurst. The articles shown are varied in form, and in the ornament bestowed upon them, including many of utility, in addition to others of purely decorative value. A feature this season has been made by Mr. Marks of caskets for the toilet table or for cigarettes, and some half-dozen of varied sizes are shown,

wild flowers being employed in the ornament. A fine loving cup, the body of which is decorated with light sprays of the wild rose, is a noticeable object in the collection, and would be a welcome addition to the plate of one of our City guilds. To accompany the casket referred to above there are brush trays, pin trays, and silver brushes, each of which has received some dainty decoration at the hands of the craftsman. Amongst the larger pieces are several rose-water dishes and bowls, one of the latter being especially good in treatment, the flower chosen being the king cup, or marsh marigold. The work on this bowl is in high relief, and has evidently received the utmost care, the modelling of leaves and petals being very accurate and effective.

At a meeting of Aberdeen University Court it was reported that the members had had before them a report by the Sites and Plans Committee, with accompanying plans and estimates, showing the erection of a wing to the south of the existing Marischal College buildings, and facing Broad Street, which would accommodate the Administrative and Law Department, with either the Library or the Wilson and Grant Bay Museums, and the extension eastward along Longacre and the accommodation for the departments of Natural History and Physiology. The Committee reported to the Court that, in their opinion, the proposed extensions would suitably provide for the remaining requirements of the University, and would form, with the retained Greyfriars Church, if properly restored, an effective scheme architecturally which could be carried out at a reasonable cost. The Committee accordingly recommended the University Court to agree provisionally to the proposal of the Town Council that Greyfriars Church should be retained and restored, provided that the anonymous donor at whose suggestion it was formerly resolved by the Court to endeavour to preserve the fabric of Greyfriars, but use it for academic purposes, would continue his offer of £10,000 to the extension scheme under the new proposal. The recommendations were agreed to.

ALCESTER wants a new infirmary, but Alcester does not quite know what sort of building to erect. After submitting plans to the Local Government Board, and having them sent back for certain suggested alterations, the Board of Guardians, when the alterations have been carefully made, reject the plans as being not quite after their own heart! A report in a local contemporary states that the Infirmary Building Committee, having had before them the plans for the new workhouse infirmary as amended by Mr. Ward, the architect, in accordance with the suggestions made by the architect to the Local Government Board, reported to the Board of Guardians that the architect appeared to have adopted those suggestions in every particular, and the plans were now ready for the final approval of the Local Government Board. In addition to a great saving in the annual expenses of administration by these alterations, a further saving of about £450 would be effected in the initial outlay, and the committee, therefore, recommended that the plans be adopted.—A lengthy discussion followed, in the course of which Mr. J. Fisher said he thought if the corridor and lying-in ward were dispensed with, there would probably be a saving of £700 or £800.—The Chairman pointed out that the Local Government Board would not pass the plans if this alteration was made.—Mr. C. Hodges moved that the committee's report be adopted, and the plans sent to the Local Government Board. The Rev. A. H. Williams seconded.—Mr. Fisher considered the plans too elaborate, and moved that they be not accepted.—Mr. E. T. Blake seconded the amendment, which was carried by fourteen votes to twelve.

THE result of the appeal recently issued for subscriptions to enable Messrs. Willis, the organ builders, to carry on the work of the grand instrument in Gloucester Cathedral from the point of equipment where they were compelled to stop at the time of the additions

and restorations nine years ago through want of funds, has been so satisfactory that it has been decided to commence the additions at once. The estimate for the cost of the stops necessary to bring the organ of Gloucester Cathedral into line, as it were, with instruments in other cathedrals and abbeys in the land is £650. The organ builders left the space now to be filled provided for, and so in the matter of structural work there will be no delay. The additions so provided for are:—Fourth Manual: Tuba, Clarinet, Orchestral, Oboe and Flute. Swell Organ: Contra Fagotto. Choir Organ: Cor Anglais. Pedals: Principal and Ophicleide. There is nothing here but what may be said to be absolutely necessary for the proper equipment of a cathedral organ. Before the additions are made it will be necessary to give the organ a thorough cleaning.

THE concession made by the Plymouth Town Council to the local architects who were invited to send in competitive designs for the buildings to be erected in Tavistock Road and Tavistock Place did not meet the whole of the grievances. It was decided to increase the premium for the best design from £150 to £250. The architects replied to this by an expression of regret that the main point of their objection to the condition had not met with a more favourable reception. The town clerk was thereupon requested to ask whether, if the Special Works Committee were prepared to consider the suggestion submitted, the architects would waive their requirements in relation to the appointment of a professional assessor. To this the architects replied unanimously declining to compete unless a professional assessor was appointed. The committee then resolved that the views of the architects be met to the following:—A professional assessor to be agreed to, provided the plans become the property of the Corporation, the premium to the successful architect to be £250, and competitors to be instructed that the rents to be catered for are to be about £100 per annum, with the exception of the two end sites, which are to be specially treated. The remuneration of the assessor is to be fifty guineas. The town clerk was to obtain the views of the architects upon the offer, with a view to obtaining the sanction of the committee to the selection of an assessor.

THE work that is being carried out for the Marquess of Bute, under the direction of Mr. C. B. Fowler, F.R.I.B.A., in marking the grave of Llewelyn Bren in the restored floor of the Greyfriars Monastery Church at Cardiff, and that of Bishop Ecclescliffe in the floor (also restored) of the Blackfriars Monastery Church, is making good progress. In the excavation of the Greyfriars floor a large number of remains of broken stonework used in the original building were unearthed, and these remains have enabled Mr. Fowler to trace out the form of Architecture employed. It is intended to erect a small building near the Blackfriars Church as a museum for the storage of all these relics. At the Corpus Christi festival at Cardiff Castle a few days ago the altar was erected on the very site of the old high altar of the Blackfriars Church, and the tomb of Bishop Ecclescliffe, with its new memorial stone, finds a place within the chancel in front of that altar. In the Greyfriars Church the new tile floor, after the original design and in the colours of the order, has been laid by Messrs. Godwin and Son, of Lugwardine, near Hereford. The memorial stone for Llewelyn Bren, like that over the remains of Bishop Ecclescliffe, is of the very hardest product of Portland, and both memorials were executed by Mr. Clarke, of Llandaff, under Mr. Fowler's supervision. Lord Bute has carried out a useful work in thus preserving to history and marking for futurity the resting places of two great men.

THE Chancellor of the diocese of St. Albans held a Court at the St. Albans Cathedral, at which an application was made on behalf of Lord Aldenham for a faculty to be decreed authorising him to complete the work of restoring the cathedral "high altar

screen." Lord Grimthorpe, it was stated, had had notice of the citation, but he had not entered an appearance, and the application was unopposed. In giving judgment the Chancellor said that when he decreed the citation he thought it right, having regard to the exceptional position which Lord Grimthorpe occupied with regard to the cathedral, to order that the petitioners should give notice to him that the citation had been issued. In 1890 there was a suit about this screen in this Court, Lord Grimthorpe opposing a faculty sought by Lord Aldenham. The suit was a very remarkable one, and it was described by Sir Francis Jeune at the time as being almost unique. Both gentlemen sought to find out who would be allowed to spend the most money on this cathedral, and Lord Grimthorpe was successful. As to the present application with regard to the proposed representation of the Resurrection he need not say anything, and as to the intention to complete the central group on the screen to represent the Crucifixion the only question he had to consider was whether there was anything in it which would be likely to lead to superstitious reverence being paid to the figure of our Lord. There are many possibilities, but it was not to those the Court should look. The probabilities alone should be considered, and he could not see any grounds for supposing that superstitious reverence was likely to be paid to the central figure of the group. It was most material to bear in mind that any adoration of the crucifix was now in the Church of England unlawful. There was nothing in the present instance which led him to the conclusion that superstitious reverence was likely to be paid to the central figure, and he would, therefore, grant the faculty asked for.

AN important discovery has just been made at Peterborough Cathedral. During the underpinning of the north-east corner of the Eastern Chapel the workmen came across the Saxon ditch. The foundations of the Eastern Chapel were found to be partly built on the ancient Saxon wall, which was a great surprise, as it was considered that the building was in the vicinity of the old Saxon ditch which bounded the original Medehamstead, or ancient Peterborough, and that the area of the ditch accounted for the sub-idence. The discovery just made, however, settles the question as to the direction of this ancient waterway, and even of its locality. At the depth of about 12ft. the rock was found to have been cut right through to the underlying clay in a direction running about east and west. But the most remarkable feature of it is that instead of there being evidences of mud or of any deposit of an alluvial character, the ditch was seen to contain a layer of about 2ft. of peat ashes. The ditch was found to empty itself through a well-defined pass in the Saxon wall; it evidently ran in a line with the present wall of the church.

THE members of the Lancashire and Cheshire Antiquarian Society recently visited Wardley Hall, Worsley, which has lately undergone a complete restoration. Mr. G. C. Yates (who led the party) read a paper in which he gave some historical account of the old building, and pointed out its more interesting features. When the work of restoration was commenced, he said, it soon became apparent that there was much more of interest in the house than was at first supposed. In all cases where there were beautifully panelled ceilings, formed of massive and richly moulded oak beams, it was found that the most prominent of the mouldings had been roughly chopped off, and on or below them had been nailed laths, and the whole hidden by plastered ceilings. Where the larger beams projected—all being of oak—they had been at some former period hacked over and covered with plaster, their sections being converted into plain rectangles, with chamfered edges, and (as if to add insult to injury) these "improved" beams had been painted and grained in imitation of oak. The fine old staircase had been similarly treated. The whole has now been restored as far as possible. Visitors to Wardley Hall, Mr.

Yates said, will probably miss some of the black and white work with which they were so familiar, but as all that on the north front was sham—being painted plaster, and not timber work at all—it was thought best not to replace it, but to restore the old brick walls which it covered. The restoration, though a costly matter, has resulted in saving from ruin one of the most interesting old houses in Lancashire. The skull—popularly supposed to be that of Father Ambrose—which has been preserved at Wardley Hall for generations, was, during the progress of the work, placed in an iron safe, and afterwards reinstated in the niche upon the staircase, where it has so long lain, protected with glazed doors.

AT Messrs. Branch and Leete's Hanover Rooms, an interesting collection of ancient furniture, silver, and art objects is now on view. The majority of the exhibits come from the Weber-Chapuis Museum at Verviers, in Belgium. They comprise an unusually large selection of early French, German, and Flemish pieces of cabinet work, some extremely interesting 13th century ivories, and silver and ivory casket work of a somewhat later period. The china includes typical specimens of Dresden, Sevres, Palissy, and Old Chelsea, and some rare porcelains. Old English silver of the Queen Anne pattern is much in evidence amongst other attractive pieces of plate, one silver-gilt hanap being a fine example of repoussé work at its best. Ivory miniatures, Japanese sword guards, and specimens of antique arms and armour are present in this varied collection, which also contains a few oil paintings and engravings by distinguished masters.

THE new buildings at New College, Oxford, facing Holywell, have been designed by Mr. Champneys, and are practically a continuation of the buildings known as Pandemonium. The task of joining these lighter buildings on to the massive and towering structures of Sir Gilbert Scott has not been an easy one. A new tower and entrance lodge have been built in memory of Mr. Robinson, late Bursar of New College, and this tower serves in some measure to reduce the hideous altitude of the Gilbert Scott buildings. Although the new buildings compare very favourably with the other additions that have been made within recent years to the Architecture of Oxford.

OF the many improvements that are in hand or are spoken of at Felixstowe—which include a projected pleasure pier, a couple of huge hotels, a promenade concert ground near the Spa, and the commodious shelter on South Beach—the most important is that which has been carried out by the Great Eastern Railway Company. Sir William Birt, the general manager, realising that Felixstowe has a future as well as a present, has advised the directors to such purpose that on July 1 the reproach which has hitherto existed with regard to the railway communication from London will be removed. The sensible course has been adopted of constructing a terminus for the branch line from Ipswich nearer the centre of the town than either of the stations which has hitherto sufficed. In order to do this it has been necessary to construct about two miles of railway, which will connect by one curve the new terminus with the little line to the steamboat pier, at which the Belle steamers as well as the G.E.R. boats call, and by another loop continue the Ipswich line to Felixstowe direct. The Great Eastern directors have not been content with giving the new station a pleasing elevation of red brick, with Bath-stone dressings, red-tiled roofs, and a central dome, which is already called, from its shape, the "lighthouse," but they have also provided the public with a splendidly-lighted "circulating area," or promenade, 92ft. broad and 84ft. long, under cover.

THE annual meeting of the Society for the Protection of Ancient Buildings was held the other day in the meeting room of the Society of Antiquaries, Burlington House, under the presidency of the Bishop of Bristol. Lord

Balcarras moved the adoption of the report, and, in doing so, said that he thought the society had done a great deal during the last year. It would be almost a truism for him to point out that many interesting and valuable buildings of bygone times had been restored, or, in other words, destroyed, without the efforts of the society being able to effect any protection whatever; but they must not relax their vigilance and energy for a moment. If they could persuade more persons to act as local correspondents of the society it would certainly save the society much trouble, and in every way expedite its proceedings. Mr. Lovibond seconded the motion, which was agreed to. Mr. H. E. Luxmoore read a paper on "Our Purposes and Prospects." The Bishop of Bristol, in moving a vote of thanks to the lecturer, said that they had to face the fact that in England we were terribly crowded. In former times there was more room for building; now, time after time it was brought to his notice that a larger number of persons had to be got on to a given area than before, and that could only be done by increasing the number of stories in a building. The higher they went on a certain frontage the worse and worse the effect usually was. He must say, however, that when they went into the City of London on a fine Sunday afternoon, when they could really stand and look at things, they found out that beautiful buildings, very striking buildings indeed—buildings that would be no discredit to Venice or to Florence—had been put up in the City of London in quite recent times, and many of the architects of those buildings did not get the credit for their work. That was an answer to a good many of the criticisms with regard to the removal of old buildings. At the same time he expressed the fullest sympathy with the objects and principles of the society.

In consequence of the ever-changing level of the Italian coast, which, writes a Venice correspondent, seems to rise and fall during the centuries like a tide, places which a few hundred years ago were on the seaside are now miles away inland. Ravenna, for instance, lies a good eight miles in shore, and its old quays are still to be traced under the accumulated travelled earth, and its once famous lighthouse dominates wide-spreading waves of green vegetation instead of blue water. Adria, again, which is but a few miles away from Venice, beyond Chioggia, once an important Etruscan city, with its great harbours and arsenal, and which gave its name to the Adriatic Sea, is now but a tiny country village, over seventeen miles from the coast. Halfway between Adria and the sea, just behind the marshlands and lagoons which form the estuary of the Po, lies another village, Donada, which is a great place for pottery and brick-making.

LAST November one of the manufacturers had occasion to reconstruct his furnaces, and while digging out the ground for the foundations, he came upon a large number of objects connected with shipping, such as rings, pulleys, bolts, and rudders, and then upon the whole hull of an ancient ship. For a time giving up thought of his furnaces, he continued his work of exploration, in connection with the authorities, and shortly came upon another complete hull. Naturally much interest was created. The Minister of Marine sent experts to examine the ships, and they were found to be in admirable preservation, hermetically sealed from the air, as they had been, in the deep peaty deposit in the undersoil. They were carefully removed and placed in the atrium of one of the chief houses of Donada for fuller examination by the Commission of National History. The Commission reported them to be most interesting specimens of early fifteenth century construction, and the Government has therefore ordered them to be preserved in the Arsenal of Venice. There is an intricate network of canals running through the wide-spreading marsh-lands that extend all the way to Ravenna, so it is possible to bring the hulls to Venice without entering the Adriatic and running the risks of a possible storm.

THE LIFE-WORK OF WILLIAM MORRIS.*

By F. S. ELLIS.

(Continued from page 358.)

IF anyone desires to test for himself the truth of what I have advanced concerning cathedral glass, I would recommend an inspection of Wells Cathedral by way of example. The glorious east window remains as a witness against the monstrous crudities and platitudes that surround it on every side, to the utter degradation of a noble branch of ancient Art. Mr. Lewis Day, in his most valuable and interesting paper on the "Making of a Stained Glass Window," tells us how the modern science of chemistry has enabled artists to come at all the component parts of ancient stained glass. In like manner a chemist can analyse the finest wine, and set out all its component parts, but putting them together will not make the wine, sun and soil and atmosphere are left out of account; and so in like manner, when we have every material and method that a mediæval glass painter used, we lack the simple unquestioning belief which imparted life and spirit to his work—the body may be there but the soul is wanting—it is but imitative work. It is impossible to speak of the life-work of William Morris without mentioning his poetry and other literary work. It is true, on the other hand, that I can speak of no part of his work, or of his doings, without speaking of his poetry, for verily his whole life was a poem, in its highest sense; his aspiration for the good and beautiful in Art, his love of and entire devotion to Nature, his abounding hatred of cruelty, injustice, robbery and wrong, his whole-hearted identification of himself with the cause of the oppressed, his recklessness of the consequences to himself in his endeavour to carry out his ideals, his contempt for worldly honours; all this made

HIS LIFE A POEM

in itself, and as such, I feel confident it will come to be understood, when the mists that envelope us are cleared away, and he and his work are viewed by unbiassed eyes in clear perspective. But to speak specially of his literary work, when we call to mind that his metrical writings amount, at a rough computation, to more than 150,000 lines, and add to them those wonderful prose poems which were the product of his later years, we can scarcely fail to be altogether astounded, not only at the fecundity, but also at the untiring industry of the great genius who gave to the world this glorious treasure of poetry of the highest order

AMIDST THE DISTRACTIONS OF COMMERCIAL BUSINESS,

the study of a dozen different handicrafts, the production of innumerable designs for wall-papers, tiles, textile fabrics, and carpets, the direction of a printing-press, and the carrying on of a political propaganda. Yet I venture to aver that none of his verse bears signs of haste or carelessness. I have in my possession a large mass of his original MSS., which bear witness to the care with which he would try his wings until he got fairly into flight; he would freely correct, alter, and rewrite, till he had satisfied himself with his work: that done and fairly copied, he rarely made any further alteration, and I should doubt if any poet returned cleaner proofs to the printers. His

REVISION OF SUCCEEDING EDITIONS

was of the slightest—rarely did he alter a single word. But this did not arise from indolence, but from his faculty of seizing the aptest word or most felicitous phrase with little effort, and, once adopted, he was ultimately satisfied with it. Morris's wealth of diction can scarcely fail to strike any reader of his works who knows what that phrase means. So completely was he master of his mother tongue, that he had not an English

dictionary among his many books until, about a year before his death, he was induced from curiosity to buy "Skeat's Etymological Dictionary." Words seemed to well up in his mind as he wrote, as water-bubbles from a spring. So great was his facility of composition on occasions, that when the tide once flowed it seemed to rush on irresistibly. It is notably on record that, when the story of Jason had taken firm hold of his imagination, he wrote continuously in one day, beginning at four a.m., 750 lines. In turning over some of his MSS. lately, I came on a memorandum made by him on the foot of a page, "310 lines after ten p.m." It is no unusual thing to hear people affect the opinion that quantity comes before

QUALITY IN MORRIS'S POETRY,

an allegation that I do not hesitate to traverse. I never yet put one of these cavillers through his facings, as to how much he knew of the work he was carping at, that I did not succeed in running him down to the confession that his knowledge of the poet he criticised was confined to reviews and extracts. Some one, as rash as he was ignorant, lately ventured to say in print somewhere that the author himself held but lightly by his work of "The Earthly Paradise." Never was a more unfounded statement. Had there been any ground for it, the production of the sumptuous edition of the book printed at the Kelmscott Press would assuredly not have been one of the author's cares during the last months of his life. The great northern epic of "Sigurd the Volsung," must, I think, be looked upon as

MORRIS'S SUPREME POETIC TRIUMPH,

and he certainly regarded it in that light himself. It is not only the masterly way in which he has evolved the grand and stately story from the ancient legend; but the pathos, passion, and nobility thrown into it, make the reader feel that here he is truly face to face with one of the world's great poets. The splendid roll of the rhythm, which never for a moment flags, and the masterly manner in which the language is handled, cause one now and again to pause in admiration, and to wonder at the unexpectedness yet perfect aptitude of the phraseology; the words seem to spring forth, as it were, by magic, and every line palpitates with vigour, life, and light. Morris, in this great poem, seems to wield the English language as Sigurd wielded the Light of the Branstock, the gift of Odin, every word and sentence coming home

WITH IRRESISTIBLE POWER AND MIGHT.

When the book was published, in 1878, though the grandeur of it was acknowledged and recognised by most of the reviewers of the day, the critic, whoever he may have been, who at that moment was powerful at the Times office, put a studied insult upon it by coupling it with a volume of verse by a poetaster which had appeared about the same period. It mattered not: the book was, and will remain, a glorious contribution to the main stream of

"Poetry's unfailing river,
Which through Albion winds for ever."

Where, in the whole range of English verse, shall we light upon nobler numbers than in the pathetic description of Sigmund delivering the dead body of his son, Sinfliotli, to Odin, after he had been poisoned by his stepmother Borghild?

"Then he lifted him up from the hall floor and bore him on his breast,
And men who saw Sinfliotli deemed his heart had gotten rest,
And his eyes were no more dreadful. Forth fared the Volsung child
With Sigay's son through the doorway; and the wind was great and wild,
And the moon rode high in the heavens, and whiles it shone out bright,
And whiles the clouds drew over. So went he through the night,
Until the dwellings of manfolk were a long while left behind.
Then came he unto the thicket and the houses of the wind,
And the feet of the hoary mountains, and the dwellings of the deer,
And the heaths without a shepherd, and the houseless dales and drear.
Then lo, a mighty water, a rushing flood and wide,
And no ferry for the shipless; so he went along its side,
As a man that seeketh somewhat: but it widened toward the sea,
And the moon sank down in the west, and he went o'er a desert lea.

* A paper read before the Applied Art Section of the Society of Arts in May last.

But lo, in that dusk ere the dawning a glimmering
over the flood
And the sound of the cleaving of waters, and Sigmund
the Volsung stood
By the edge of the swirling eddy, and a white-sailed
boat he saw,
And its keel ran light on the strand with the last of
the dying flaw,
But therein was a man most mighty, grey-clad like
the mountain-cloud,
One-eyed and seeming ancient, and he spake and
hailed him aloud:
'Now whither away, King Sigmund, for thou farest
far to-night?'
Spake the King: 'I would cross this water, for my
life hath lost its light,
And mayhap there be deeds for a king to be found on
the further shore.'
'My senders,' quoth the shipman, 'bade me waft a
great king o'er,
So set thy burden a ship-board, for the night's face
looks towards day.'
So betwixt the earth and the water his son did
Sigmund lay:
But lo, when he fain would follow, there was neither
ship nor man,
Nor aught but his empty bosom beside that water
wan,
That whitened little by little as the night's face
looked to the day.
So he stood a long while gazing and then turned and
got him away:
And ere the sun of the noon-tide across the meadows
shone
Sigmund the King of the Volsungs was set in his
father's throne,
And he hearkened and doomed and portioned, and did
all the deeds of a king.
So the autumn waned and perished, and the winter
brought the spring."

Never did any poet write more genuinely
and spontaneously from inspiration, without
giving one moment's consideration to the
question whether what he thought of writing
would be likely to find acceptance with the
public, or, in other words, whether it would
sell. He wrote for Art's sake, and for Art's
sake only. I well remember that in early days,
some thirty years ago that is, he used to be
curious as to how his verse would be received,
but of later years he was wisely impervious to
hostile criticism, though he was always grate-
ful for intelligent appreciation. He was, in
truth, an able critic of his own work, and was
happily confident of future fame. Inwoven as
it were with Morris's life work, was a happy
circumstance which for twenty-five years
helped to give to it colour, vigour, and happi-
ness, and contributed in no small measure, I
venture to think, to the value and beauty of
all he set his hand to. This was the acquisi-
tion, as a dwelling, of

THE ANCIENT MANOR HOUSE AT KELMSCOTT,
in Oxfordshire. Scarce could the magic wand
of a magician have called into being a home
more suited to his taste and sympathies than
this secluded spot, close to the stream whose
gently sloping uplands, flower-bearing banks,
willowy nooks, rush or reed grown reaches,
clear shallows, and swirling eddies, are so ex-
quisitely pictured in his poems. The grey-
weathered walls of the stone built gabled
house, surrounded by an old garden with a
moss-grown orchard and a meadow close hard
by, made it the very place of retreat he had
longed for. He once told me that when he first
went to look at it he found that it exactly
resembled a house he once had a vision of in
a dream.

TO ESCAPE TO KELMSCOTT,

from the smoke and turmoil of London, when
he had any special work, literary or graphic,
on hand, was of the greatest benefit to its
successful accomplishment, or to go thither
and throw off work altogether for a short
season occasionally, was the most grateful re-
freshment to his mind. But even while his
spirit was filled with the great epic of the
North, his eyes had been pasturing on the
rich colour and inimitable designs of the
East. So far as my memory serves me, it
was about 1875 that his mind was specially
fired by the magnificence of the ancient
oriental carpets which were just then im-
ported in large quantities. He bought a
great number of choice examples, and set
himself to study not only the scheme of de-
sign and colour, but also the method of
manufacture.

HIS STUDY OF DESIGN,

whether in this or anything else, did not mean
crude and ineffective copying of original
patterns, but as in literature his style is no

servile following of ancient form, but an
assimilation of so much as is good and valuable
in it, so did he assimilate the manner of the
ancient traditional patterns of the East, and
thence produce thoroughly original and har-
monious work, graceful in line and beautiful
in colour. It was no light matter to begin
such an undertaking. There was no ware-
house whither he could go and buy such wools
as he needed ready to hand; he must dye them
himself, and with an enterprise and unwearied
determination rarely equalled—never certainly
by one who was also a great master in song—
he set himself to learn the craft and practice
of dyeing, first carrying it on in the cellars of
his dwelling house at Queen Square, and sub-
sequently at the works which he established
at Merton. Having thoroughly mastered the
art himself, he soon set others to work, with a
result that had but one fault, namely, that the
work he produced was

TOO ABSOLUTELY GOOD AND PERFECT

to meet with general acceptance in the more
costly forms, but nevertheless the Buller's
Wood and the Peterhouse carpets, and many
another, will for long years to come testify to
the success and excellence of the manufacture
while the simpler webs have been distributed
far and wide to the brightening of many
hundreds of homes. Another great project
which he carried out to its fulfilment with
perfect success, as you may see by the splendid
examples exhibited this afternoon, was the
restoration of the manufacture of tapestry as
a fine art in England, where in old days it had
rivalled the work of our neighbours over-sea,
but had latterly died out altogether. To make
himself a master of this art, he set up a loom
in his bedroom at Hammersmith, and there
worked a panel with his own hands. The
difference between Morris's work and the

MOST COSTLY KIND OF TAPESTRY

made elsewhere is not, I believe, so much
technical as æsthetical. The art has unfortu-
nately been diverted from its true decorative
character to the copying of pictures which do
not properly lend themselves to such repro-
duction, and were never intended for it.
Morris worked from designs made specially for
the purpose for the most part. Those who
have had the good fortune to see the magnifi-
cent hangings in the dining-hall of Mr. Darcy's
house at Stanmore, representing the "Quest
of the Holy Grail," will understand how great
a triumph has been achieved, where the
designs of Sir E. Burne-Jones are worthily
worked out under the great craftsman's
personal superintendence. The piece of the
"Four Seasons," which was exhibited in 1896
at the Arts and Crafts, was designed by
Morris himself, and I think will be allowed to
be no mean witness to

HIS POWER OF DRAWING THE HUMAN FIGURE

when he was put to it by necessity, as happened
on this occasion. Among the many arts to
which he applied himself with notable success
I must not omit the mention of one which has
scarcely been heard of beyond the immediate
circle of his private friends, though he bestowed
much time and attention upon it, and attained
to great skill in its practice. I allude to the
truly mediæval art of calligraphy. This, like
many other of his labours, would have been
with an ordinary man an exclusive and absorb-
ing life-study, not so with Morris, he studied
it at odd moments, and pursued it as a pastime,
to fill up a few odd hours as it were. Numerous
volumes are in existence to bear witness to the
mastery he attained in this beautiful art,
many of them being

ENRICHED WITH ORIGINAL DECORATIVE DESIGNS.

Among the specimens of his calligraphic skill
are several translations of the Icelandic Sagas,
but his masterpieces were Fitzgerald's transla-
tion of the "Quatrains of Omar Khayyam,"
and the works of Horace and Virgil, the latter,
unfortunately never completed. I should do
Morris's memory a great wrong if I were to
omit all mention of the noble stand he made
against the destruction of ancient works of
art at the hands of the ruthless restorer and

the commercial wrecker. As a foremost founder
of the Society for the Protection of Ancient
Buildings, in company with Mr. Thackeray
Turner and others, he did work that entitles
him to the gratitude of every man and woman
who has any true love for the glory of our
ancestors. Nothing but absence from London
ever kept him from the weekly Thursday
evening meeting of the Society, and often
would he return to town from a great distance,
at extreme inconvenience to himself, that he
might attend to what he looked upon as

ONE OF HIS MOST IMPORTANT OBJECTS

in life. Innumerable were the letters he wrote
on the subject, and great was his grief when,
as but too often happens, the destroyers were
deaf to all appeals. Nevertheless, the good
work done by this modest but energetic
Society can hardly be overrated, and I would
earnestly urge on everyone in this assembly,
who has any love for ancient Architecture, and
any real reverence for the memory of William
Morris, that there can be no better way of
showing it than by becoming a member of the
Society for the Protection of Ancient Buildings
at the trifling subscription of 10s. 6d. per
annum. While considering Morris's life-work,
it is impossible to pass over one subject which
for about fifteen years absorbed a vast deal of
his time and attention. Though it may
appear on the surface to have no direct rela-
tion to the study, practice, and teaching of
art, he firmly believed that it went to the root
of the whole matter, inasmuch as he held that
there could be no good craftsmanship while
the craftsman was

IN A STATE OF DEGRADATION.

I refer, of course, to the Socialist movement,
into which from about 1881 he threw himself
heart and soul. When once he became con-
vinced of the justice of the cause, he cast
aside all considerations of personal taste, ease,
and comfort, doing violence, as I well know,
to his own feelings and predilections, and forcing
himself to personal work and labour that was
absolutely distasteful to him. I must confess
that it amazed me to see how earnest he was
in his belief that some great change in the
constitution of society could be wrought
suddenly, and by direct means. Never did
any man give himself to a cause with purer
unselfishness and more hearty devotion. Per-
sonally, he had everything to lose (as the
world counts such matters), and nothing to
gain. Fame he had already possessed, and

NOTORIETY HE GENUINELY AND UTTERLY SCORNEO.

For some years he bore the whole cost of
printing a weekly paper, which never ap-
proached within a long distance of paying its
expenses. He was not overburdened with
ready-money at the time, and even sold his
cherished books to provide funds. But he
spent not only money, but a large share of his
time in writing about current politics, which
were altogether hateful to him. But, unlike
those men who quarrel with all who do not
share their own enthusiasms, I never knew
him to attempt to thrust his opinions on those
who differed from him, and I greatly doubt if
he lost a single one of his old friends through
his generous espousal of an unpopular cause.
In his later years, though he did not alter his
opinions, it appeared to me that he was satis-
fied that any chance of forcing on a sudden
change was altogether hopeless. Who is there
but must admire

THE ARDOUR WITH WHICH HE WORKED,

not merely by giving moral and pecuniary
support to the cause he had adopted, but in
leaving his comfortable home and pleasant
literary and artistic occupation to go forth
early in the morning to speak at the dock
gates and street corners, attending innum-
erable evening meetings in localities that were
anything but grateful to his æsthetic tastes,
and travelling thousands of miles to the Mid-
lands, the North of England, and Scotland, to
speak at public assemblies, and all with no
hope of other reward than that which arose
from the consciousness of doing work which
he firmly believed to be for the benefit of those
who most needed his help. But the neglect

of his business, which this disinterested political activity made inevitable, had a far different result than what might have been expected. Being left to the able management of the two gentlemen whom he latterly took into partnership, the business flourished far more than it is likely it would have done otherwise, and so led to the great undertaking which, in my eyes at least, was the crowning work of his life, namely, the establishment of the

NOW FAMOUS KELMSCOTT PRESS,

and, moreover, afforded him the means of collecting the magnificent library of illuminated manuscripts and early printed books which was the delight and solace of his last years. The ordinary nineteenth century printing and book illustration had long been a thorn in his side. I well remember how, some twenty-five years ago, he took up a volume printed by Aldus about 1490, in his earliest and best manner, and exclaimed as he turned over the pages: "Ah, I wish I could get my books printed like that!" But to hope for the fulfilment of his ideal of typography by applying to any of the ordinary commercial printing offices would have been as futile as to attempt to get wallpapers to his taste from the ordinary decorator: there was but one way—to do the thing himself. But the starting of a press and the casting of founts of type are no slight matters, and had not money been coming in pretty freely from the business, under his partners' able management, I do not suppose that "The Golden Legend," the "Chaucer," or other noble

MONUMENTS OF ARTISTIC TYPOGRAPHY,

would ever have seen the light. As it had been with his previous undertakings, so it was with this. The whole scheme bristled with difficulties and hindrances at the outset, which would have deterred a man of less resource and determination from going on with it. But his knowledge of caligraphy and early typography, coupled with the able assistance of Mr. Emery Walker, rendered him independent of the ordinary means of starting a press, and for the first time since printing has been practised in England, type were designed and cast which are at once useful and artistic. Morris has not unfrequently been complimented, by writers who knew no better, on being the best English printer since Caxton; the fact being that, although we honour Caxton's name as the introducer of typography into England, and as a writer of sterling English, it may safely be said of him that he was the worst printer of the fifteenth century. His types were rude,

HIS WOOD-CUTS BENEATH CONTEMPT,

and his presses of the weakest, while his texts were faulty beyond measure. The founder of the Kelmescott Press happily lived to see the completion of the book upon which, of all others, he had set his heart, viz., the monumental edition of the works of his master, Geoffrey Chaucer. By a happy conjunction of circumstances, two editions of the great poet have been given to the world in forestalment of the five hundredth anniversary of his death, now closely upon us; Professor Skeat's Clarendon Press edition being a monument of textual labour and scholarship, and the Kelmescott Press edition being, I do not hesitate to say, for typography, ornament and illustrations combined, the grandest book that has issued from the press since the invention of typography. It was but three short months before the end came that Mr. Douglas Cockerell arrived at Folkestone,

WHERE THE DYING POET WAS STAYING,

with the first completed copy of the Chaucer bound from his own design. The title page had been his last great work, and he turned over the pages with evident gratification, weak and feeble as he then was. How many grand books might have issued from the Kelmescott Press had the master's life been prolonged it is impossible to say, but three books he had specially in his mind, to wit, Shakespeare, the English Bible, and Froissart's "Chronicles;" for the last-mentioned he had already designed some borders. Alas! these three glories of the English language are, in

all likelihood, destined to wait long ere they appear in such guise as Morris desired to bestow upon them. To sum up, then, for forty long years were the teeming brain and the deft hands of this indefatigable worker busy for the benefit of his fellow men; from the day, we may say, when he projected the Oxford and Cambridge Magazine in 1856—when the world seems to have been almost young as we look back upon it—till within a few days of his death in 1896. And how truly marvellous had been that work, how many homes have been made more cheerful and happier by the

BRIGHTNESS AND BEAUTY HIS GENIUS HAS BESTOWED

upon them; what love of antiquity has his teaching awakened and kept alive; how many ancient monuments have been saved from destruction by his efforts; what new life has he given to the art of design, if men will but have the wit to learn the lessons he has afforded them; what a storehouse of delight and pleasure has he laid open to us in his immortal verse and those magnificent prose poems—his romances—and what a glorious halo has he shed round him by the nobility of his character. In all the intimate relationship of business and private friendship that I had with this great man, extending over a period of more than thirty years, I never knew him to give countenance to an action of which any man might be ashamed, and a falsehood was as foreign to his lips as snow in midsummer: to attempt to get the advantage over his fellow man was a thing that never for one moment entered his mind. He has in truth left us by his life-work a glorious heritage which all men enjoy, and truly may it be said of him, that "He being dead yet speaketh."

TINTERN ABBEY ON SALE.

RARELY, indeed, have such attractive, extensive, and interesting properties been in the market as the estates in Monmouth and Gloucestershire, which the Marquis of Worcester has decided to sell. Moreover, it may be remarked that Messrs. Driver and Co., who have the estates in hand, have reversed the usual order of things, and, instead of offering the properties first of all by auction, they begin by submitting the properties for sale by private treaty. It will be curious to see the results. In the meantime, the disposal of such estates will be a large event in the property market. Let us just look what they include. There is that glorious ruin, Tintern Abbey, Raglan Castle, Monmouth Castle, Chepstow Castle, Usk Castle, and other feudal ruins, twenty manors, eighty farms, comprising 13,000 acres, which will be sold singly or in blocks, valuable fisheries, sporting rights, small holdings, accommodation lands in the town of Monmouth, Chepstow, and Usk, twenty-eight hotels, public-houses and beer shops, and ground-rents, the whole estate producing a rent roll of £30,410. It is understood that if the properties do not sell by private treaty they will be offered by auction, the first sale being held in October. In reference to this great sale, considerable curiosity has been aroused as to the fate of Tintern Abbey. This Abbey, which dates from the twelfth century, is regarded as one of the finest historic ruins in the country, its picturesque and romantic beauty when seen by moonlight giving it a prominent place among the recognised sights of Great Britain. In many circles the feeling is entertained that the future ownership of such a splendid relic of the past is a matter of concern to the general public, and that some means should be taken to preserve it intact for the nation. The approaching sale would therefore seem to afford an excellent opportunity to the National Trust for places of historic interest or national beauty, and the matter has already been brought under the notice of the Trust. Any action, however, on the part of that body would necessarily have to be liberally supported by the public, as the revenue now derived in the shape of admission fees from the numerous visitors invests the Abbey with a definite commercial value.

A LONDON STREET SCHEME.

FROM HOLBORN TO THE STRAND.

THE Improvements Committee of the London County Council has submitted to the Council a scheme, which appears to be both bold and well conceived, for a new street from Holborn to the Strand. Every one familiar with Central London knows that the great defect in the means of communication is the absence of good thoroughfares from north to south. London, of course, owes its existence to the Thames; for centuries it clung to the river bank; and its origin is still written in its main streets. Regent Street, a comparatively recent creation, is the only main avenue from north to south which can compare with

THE GREAT TRUNK LINES ALONG THE STRAND

and Fleet Street, Oxford Street and Holborn, and the Marylebone and City Roads. Between Regent Street and the City there is not a single line of communication from north to south of any importance; there is scarcely a reasonably direct thoroughfare. It is not surprising, then, says the Times, that ever since the County Council has been in existence its attention should have been turned to the formation of a new street from Holborn to the Strand. Various schemes have been suggested; one was, in 1892, even presented to Parliament, but difficulties of divers kinds arose, and none has yet been seriously pressed upon the Legislature. Several considerations, however, point to the present as a favourable time for realising such a project, and

THE PLAN PROPOSED

by the Improvements Committee has many exceptional features to recommend it. The present scheme is to carry a new road, 100ft. wide, from a point in Holborn immediately opposite Southampton Row directly towards the Strand. The new street would absorb Little Queen Street, and, not touching, but running to the west of, Lincoln's Inn Fields, would cross the lines of Great Queen Street, Sardinia Street, Vere Street, and Stanhope Street. The approach to the Strand would take the form of a crescent, one horn of which would strike that thoroughfare at the corner of Wellington Street, thus giving direct access to Waterloo Bridge, while the eastern horn would enter opposite the Church of St. Clement Danes, and in the immediate neighbourhood of the Law Courts. In forming the road, it is proposed to

ACQUIRE THE WHOLE OF THE BUILDINGS

between the Strand and the new crescent, Wych Street being thus wholly, and Drury Lane partially, abolished. The area thus cleared would form one of the most valuable sites in London, and buildings of importance and architectural value would naturally be placed upon it. Holywell Street, and the blocks of houses between it and the Strand, would, it is unnecessary to say, disappear. The two churches of St. Mary and St. Clement Danes, on the other hand, would be untouched; and the Strand would be widened on the north of St. Mary's so as to place that striking building in a proper setting. The Law Courts would gain in dignity from the new approach and would group into the architectural features. We have said that the present is an appropriate time for carrying out such a scheme. Several improvements necessarily connected with such a street have already been authorised. The demolition of Holywell Street was sanctioned by Parliament last year. The widening of Southampton Row to 60ft. is in progress, arrangements for that purpose having been made with the Duke of Bedford by voluntary agreement; and the insanitary areas between Clare Market and Drury Lane are to be cleared and rebuilt under the authority of the Home Office and Parliament. Not only do these improvements facilitate the formation of the proposed street, but they furnish reasons against delay. The removal of the buildings between Holywell Street and the Strand will greatly raise the value of the houses now standing on the north side of the former street, and, if these are at any time to be in turn taken for

such a thoroughfare as that suggested, it is foolish to wait till their value is enhanced. The whole improvement should be carried out at the same time. Again, the insanitary areas, when cleared, will obviously be dealt with in one way if the neighbourhood remains as it is, and in quite a different way if

ONE OF THE GREAT STREETS OF LONDON runs through their midst. Hence, if the street is to be formed at all, the necessary Parliamentary power should be obtained without delay. Mr. Shaw Lefevre's estimate—Mr. Lefevre is chairman of the Improvement Committee—of the cost of the new street is surprisingly low. This arises from the fact that the property to be taken is mostly of a very poor character, while from its central position a great new street will supply sites of very great value. Poor as they are, the buildings taken (with the trade compensation incident to such a taking) are valued at no less than £1,442,500. But the selling value of the ground rents which will be created on the frontage lands is put at no less than £1,088,300, leaving a net cost of £354,200 only. To this is to be added £120,000 for the actual making of the street, with the accompanying subway and sewers, and £150,000 for the expense of rehousing persons of the labouring class displaced. The total cost thus reaches £624,200, which represents about 3-16ths of a penny in the pound on the county rates for the first year after the commencement of the improvement. Against this is to be set such receipts as the Council may obtain from a betterment rate of the character authorised by Parliament in the case of the Tower Bridge approach. The expenditure will be a mere bagatelle for a thoroughfare which will enormously facilitate traffic in the heart of London, and will give air and space and dignity to a part of the capital which is at present a mere network of obscure streets.

THE Bishop of London recently opened a new hall and clergy house in connection with St. Silas's Church, Penton Street, Clerkenwell.

JEDBURGH Police Commissioners have resolved to proceed with the erection of a new bridge across the Jed, connecting Bongate with Bridge Street. The existing bridge has been closed for some years against traction engine traffic. The estimated cost of the new bridge is £1800.

THE Bishop of Birmingham performed the opening ceremony of some new Roman Catholic schools, Willenhall, a few days ago. The schools, which will accommodate 350 children, will take the place of the old schools in Hall Street. The architect is the Rev. Canon Scoles (Yeovil), and the builder is Mr. Thomas Tildesley (Willenhall).

ACCINGTON CHURCH, Liverpool, which was erected more than fifty years ago, has undergone extensive alterations. Oak benches have taken the place of the old pews; the electric light has been fitted up throughout the edifice, and the interior has been thoroughly renovated. In addition to this two fine memorial stained windows have been placed in the building.

MR. R. K. CAUSTON, M.P., has opened the new Christ Church Public Library, in Blackfriars Road. The building consists of a large well-lighted general reading-room, a smaller ladies' reading room, and a lending library department. The cost of the new scheme, including the purchase of the freehold and the metamorphosis of two old dwelling houses forming the basis of the new building, amounts to £4500.

THE proposal to run an electric tramway from Kew to Hampton Court, through Richmond and Petersham, is meeting with vigorous opposition from many of the inhabitants in the neighbourhood, who are full of needless alarms. The scheme, which is being promoted by the London Tramways Company, will, it is maintained, entirely destroy the rural charm and picturesque character of both Richmond Hill and the unique village of Petersham, which, mentioned in the Doomsday Book under the name of Patricesham, is, like Richmond itself, fraught with classical reminiscences and interesting historical associations.

Professional Items.

ABERDEEN.—A meeting of the Torry Church Extension scheme, Aberdeen, was recently held. Instructions were given to the architect to prepare and issue the necessary schedules in order that contracts may be accepted without delay. It is expected that building operations will be commenced a month hence. The proposed new church, when completed, will contain 818 sittings, and will cost £3100, exclusive of the cost of building the boundary walls, laying out of the ground, architect's fees, etc. The part of it to be built at present will contain 550 sittings.

BRADFORD.—A new church and presbytery have recently been erected in Denaby Main, Bradford. The church contains nave and south aisle, with apsidal sanctuary in continuation of nave, and lady chapel at end of aisle, with confessional in close proximity, the choir gallery and organ chamber being at the west end. The altar, pulpit, sanctuary, balustrade, font, holy water stoups, and piscina are beautifully worked in Ancaster stone. The roof is open timbered. The whole of the buildings are erected in local stone. The work has been carried out by the following contractors, viz.:—Mr. F. Robinson, Thornton, excavator's, mason's, and bricklayer's; Messrs. Broadhead and Pickering, Bradford, carpenter's and joiner's; Mr. H. Lindley, Leeds, plumber's, glazier's, and heating; Mr. A. Taylor, Ecclehill, plasterer's and concreter's; Messrs. Y. and A. Thornton, Ecclehill, slater's; Mr. H. Walton, Frizinghall, painter's; Mr. S. Charnock, Manningham, sculptor's; Messrs. A. Seward and Co., Lancaster, stained glass; Mr. J. W. Swift, Bradford, tiling; Messrs. Nightingale and Co., Grimsby, wood block flooring; Mr. R. Burran, Bradford, electric fittings; Messrs. R. Farr and Son, Doncaster, mantelpieces and ranges; and Messrs. Thomason and Co., Birmingham, gasfittings. The architects were Messrs. Empsall and Clarkson, of Bradford.

BIRMINGHAM.—We give a description on another page of the new hotel which has been put up on the site of the famous old Hen and Chickens in New Street. The site was not large in area, but by going down 30ft. below the street for the sub-basement the utmost use was made of the available ground. The building cost about £14,000, and is of nine floors. The steel frame method of construction has been employed, and the floors are of expanded metal, with Mount Sorrel granite and Portland cement. The whole of the column in the basement is of Ross of Mull granite, and the walls are decorated with enamelled tiles, and the reception rooms of hotel with Japanese paper and Lincrusta Walton. The tiling throughout is by Messrs. Maw and Co. The staircases are of patent Victoria Stone, and the handrails of copper by Messrs. Thomas Brawn and Co., who also put in the wrought-iron work of the lift casing and the stairway sides. This work is exceptionally effective and pleasing. The sanitary fittings are by Messrs. Adams, and as perfect as it is possible for them to be made. A complete system of electricity for the lift, and for lighting also, is by Messrs. Anderson and Gooldeen. Other firms and companies represented are the following:—Casements, Henry Hope; laundry machinery, Messrs. Tullis, of Kilbowie; radiators, James Keith; furnishing, A. R. Dean; calorifiers, J. J. Royle; electric fittings, Martineau and Smith; ventilating fans, Pickup and Co., Bury.

BLITH.—A commencement will shortly be made at Blith with the erection of a new Theatre for the Blith Theatre Company. The site of the building is in Trotter Street, Waterloo. The old building—once the Zion, or Octagonal Chapel—is to be utilized as a concert hall. Simultaneously operations will be commenced in connection with the proposed new theatre in Union Street, plans for which have also been approved.

CRIEFF.—The Crieff School Board has resolved to erect a large addition to the west wing of the Commissioner Street Public School. The addition consists of new classrooms, offices, cloak-rooms, &c. It is anticipated that the addition will cost about £1200. The architect is Mr. Ewan, Glasgow.

DUNDEE.—The extensive additions which it is proposed to make to King's Cross Fever Hospital, Dundee, consist in the addition of three pavilions, each containing twenty-two beds, a discharge block to each of the existing and proposed pavilions, the completion of the administrative block, and other minor buildings. It is also recommended that all the wooden structures forming the old Hospital should be demolished. The estimated cost of the extensions is £16,000.

GLASGOW.—Hitherto the plans in connection with the reconstruction operations of the Glasgow Improvement Trust have been prepared by the permanent staff of the Corporation. Increase of work, however, has made the continuance of that arrangement impossible, and the Committee now propose to invite outside architects to submit plans and estimates. This course, which has been adopted meantime by way of experiment, will be taken for the first time in connection with the King Street area. The buildings to be erected will consist of shops and business premises on the ground floor, and dwelling-houses, principally of two rooms, on the other three stories. Premiums will be awarded for the best plans, and the successful competitor will have the supervision of the work on the usual commission.

KELVEDON, ESSEX.—A number of semi-detached cottages are about to be commenced for the labourers on Messrs. Moss and Son's seed farms in the districts near Kelvedon, and an attempt is being made to solve the problem of comfortably housing the working classes in rural districts on strictly economical lines, whilst helping to supply the long felt and increasing need for such dwellings in nearly all agricultural districts. Owing to the high price of bricks and the distance of brick yards, the materials to be used are concrete, timber, and plaster. Those to be commenced at once will have concrete foundations and party walls, chimney breasts, &c., all other walls of timber framing. The outside, up to first floor line, will be covered with rustic joint-tongued weather boarding, finished with a plain moulded string, and over this buff shingle, rough cast. The roofs will be covered with patent red "self-lock roof tiles." The accommodation provided is as follows: Ground floor, small entrance lobby and staircase, well-lighted sitting room 11ft. by 11ft. 3in., with oriel window; living room or kitchen 12ft. by 11ft. 3in., fitted with cottage range and small dresser; connected by a small covered way is a washhouse, with copper and sink, earth closets, pantries (with outside windows), and coal stores are also provided. On the first floor three bedrooms are arranged, 11ft. by 11ft. 3in., 11ft. 3in. by 9ft., and 8ft. by 6ft. respectively, all entered from a small landing. The internal woodwork will be covered with fireproof stains in various tints. The outside weather boarding, also cills, sleepers, and all timbers liable to rot, will receive two coats of rotproof staining solution. Each cottage has a quarter of an acre of land, and water supply from wells sunk on the sites. The builder of the first three pairs is Mr. W. W. Rust, of Witham; and the architect is Mr. George E. Clare, 66, Duke Street, Chelmsford.

LIVERPOOL.—The foundation stone of "Bevington House," a model lodging-house for men, was laid a day or two ago. The building has been designed by Messrs. C. O. Ellison and Son. The site comprises about 2200 square yards, and has frontages of about 45 yards to Bevington Bush, 30 yards to Nicholas Street, 35 yards to Aldersey Street, and 49 yards to Arden Street. Only a portion of this area is actually being built upon, the remainder being reserved for extensions; but the present building will accommodate 450 lodgers, whilst the scheme,

when fully carried out, will provide 650 beds. The building will be six stories high (one less than the Rowton Houses, London), with the main entrance from Bevington Bush. All floors and staircases will be fireproof; there will be a large open courtyard containing the w.c.'s, etc., and throughout the buildings warmth, comfort, and sanitation will be most carefully studied.

MIDDLESBROUGH.—The Cleveland Asylum at Grove Hill, Middlesbrough, has just been opened. The institution, which has cost £100,000, will accommodate 250 patients, but provision is made for future extension so as to accommodate 150 more patients. The asylum occupies a site of 98½ acres. The arrangements of the main buildings on both the male and female sides are excellent, the various rooms and offices for different purposes being placed in most convenient positions. The superintendent's house is practically a detached building, being only connected to the main building by a narrow corridor. There is also a detached hospital for the treatment of infectious cases. This provides accommodation for ten patients, with the necessary rooms for the nurses and caretaker. The chapel is detached, and consists of a nave, chancel, organ chamber, and vestry. It affords sitting accommodation for 204 persons. The whole of the wards and other portions of the buildings occupied or used by the patients and staff are, in addition to open fireplaces, heated by hot water on the low pressure principle.

NORWICH.—The Mayoress of Norwich has laid the foundation stone of the new Congregational Church at Topcroft. The building consists of church, porch, and vestry, erected in red brick, with Cossey moulded windows and dressings, the prevailing style being late Gothic. The size of the church is 38ft. by 23ft. 6in. It is lighted by a large mullioned window at the end, with four windows on the south side, and two on the north, glazed with lead quarry glazing and cathedral glass. There are hopper ventilators, and an exhaust ventilator in the roof. The floor is of yellow deal. The roof, covered with green slate, is wagon-headed, and supported by three framed principals, plastered between. The benches are arranged for 150. The rostrum is at the east end, and behind it is the door of the vestry. The lowest estimate, £545, was that of Messrs. S. Y. Brock and Sons, of Alburgh, to whom the work was entrusted.

SEACOMBE.—The erection of the new public elementary schools for the Poulton-cum-Seacombe School Board has been commenced by the contractor, Mr. E. Gabbutt, of Oakes Street, Liverpool. The disposition of the buildings has been arranged to provide sheltered playgrounds, for boys, girls, and infants, on what would otherwise be a very exposed site. The schoolrooms and classrooms are designed to be lighted in accordance with the most modern ideas, and are arranged in relation to one another, so that, although the rooms in each department all adjoin for convenience of supervision, any one room can be emptied of children without disturbing any other. In addition there are provided a cookery and laundry centre, also, in separate blocks, a carpenter's shop, with spacious gymnasium above, and caretaker's house. The erection is being proceeded with under the personal supervision of the architects, Messrs. T. Mellard Reade and Son, of 2, South John Street, Liverpool.

WEST BROMWICH.—The foundation-stone of a new church in Beeches Road, West Bromwich, to be known as St. Philip's, has been laid. When completed the church will accommodate 750, and will consist of nave, north and south aisles, morning chapel, chancel, organ chamber, clergy and choir vestries, with four porches. The building is to be carried out in red bricks, with buff terra-cotta dressings. The contract has been let to Mr. John Dallow, of Black Heath, and the architects are Messrs. Wood and Kendrick.

Views and Reviews.

LINCOLN CATHEDRAL.

Canon Venables has written a pleasant and interesting little account of Lincoln Cathedral. It is not exactly a handbook, it has no statistics, or lists of Deans or other dignitaries. The author meets you at the station, strolls with you through the town—pointing out everything of interest as you pass—and then takes you up "The Steep" to the Cathedral precincts, where he gives you a short account of the foundation of the original building. As you pass round, he explains the sequence of the different parts of the structure, calls your attention to anything of exceptional curiosity or beauty, and beguiles you with old world tales of bishop or saint. If occasionally a moral reflection creeps in, well—it is only occasionally. Mr. Railton contributes some pen-and-ink sketches, which, like all his drawings, have a distinct charm, but they seem rather to lack in breadth and sincerity. The book is nicely bound and printed, and it is just the size and shape for the pocket.

"Lincoln Cathedral," by the Rev. Edmund Venables, M.A., late Canon of Lincoln. Illustrated by Herbert Railton. London: Isbister and Co. Limited, 1898.

THE RENAISSANCE IN ITALIAN ART.

The time of the Renaissance in Italy is, perhaps, from one point of view, the most fascinating period in the history of humanity. Man, who for centuries had been living in the twilight like the cavedwellers of Plato, now ventured again to turn his face to the light, and fix his blinking and unaccustomed eyes on the beauty and mystery of Nature. After long years of repression, he dared again to live, to think his own thoughts, to be himself. His passionate affirmation of the grandeur and the beauty of life, and of his own right to live that life to the fullest and the uttermost, has nowhere had more striking and interesting results than in its influence on Italian Art. The glamour of this fascinating period has been felt by all men of education, whether artists, critics and scholars, to whom it has been the study of a lifetime, or cultured men of affairs who have found in it at once a relaxation, and a refining and humanising influence. To the latter class belongs the author of this handbook, who, while disclaiming any special knowledge or authority, has yet felt that there was good work to be done in classifying and placing in a readable and popular form the knowledge which already exists. A handbook for students and travellers, it is the first part of a series of three, which will deal with the schools of Florence, Venice, and Rome. This first part is devoted principally to Florence, and the minor schools of Pisa and Siena. Beginning with Cimabue, Giotto, and Niccolò Pisano, it ends with Bollicelli, and Ghirlandajo. To keep the book more readable, matters of technical criticism and processes of work have been relegated to appendices. While recognising its value to serious students, to whom it may be recommended, one yet feels that for the traveller and amateur the style is hardly as clear and easy as it might be. For instance, when several painters are referred to together, or the account of one runs into that of another, it is not always easy to tell which name the next personal pronoun refers to. One has constantly to hark back, in order to make sure. Such defects in style tend to confusion, and to diminish the attraction of a book to those who do not read with very serious intentions.

"The Renaissance in Italian Art (Sculpture and Painting)": Part I. By Selwyn Brinton, B.A. (Barrister-at-law.) London: Simpkin, Marshall, Hamilton, Kent, and Co. Limited, 1898.

At a meeting of the Paddington Vestry a letter was read from the solicitor to the vestry to the effect that a faculty had been obtained and the plans approved for the erection of a new town hall. The new hall will be built on the ground covered by and at the rear of the present vestry hall in Harrow Road, the accommodation in which is found to be quite inadequate to present requirements.

Under Discussion.

PROPOSED BUILDING EXCHANGE AT HUDDERSFIELD.

A meeting of master builders and others of Huddersfield has been held, to consider a proposition that an Exchange be established for the use of members of the building and allied trades, and members and dealers in building materials. The Mayor wrote that he felt it was not right that the young men who were being educated with the object of entering into the businesses established by their fathers should be asked to meet in public-houses to transact business, as was done fifty years ago.—The Chairman (Mr. Lewis Ratcliffe) said that associations similar to the one they desired to found were in existence in Bradford, Halifax, and Leeds, each with a large membership, and working successfully. He moved: "That it is desirable to form an exchange for the building and allied trades in Huddersfield and district, for the purpose of offering additional facilities to the members of the trades for the transaction of business between themselves, and for social purposes."—Mr. John Pyrah seconded the motion, which was adopted.—The Mayor was elected president, Messrs. Wilmshurst and Stones hon. secretaries, and Mr. T. B. Tunnicliffe hon. treasurer. A large committee were also appointed.

AN EXCURSION IN NORFOLK.

A number of members of the Architectural and Archaeological Society of the Counties of Lincoln and Nottingham, who are holding their annual excursion at King's Lynn, have visited Old Hunstanton Church and Hall, subsequently proceeding to Heacham, Snettisham, Dersingham, Wolferton, Castle Rising, and South Wootton. At a conversazione, held by the invitation of the Mayor, Mr. E. M. Beloe read an interesting paper on "Eugene Aram." Other papers were also read.

THE DUNDEE INSTITUTE.

A large number of the members of the Dundee Institute of Architecture, Science, and Art had a day in Strathearn recently. Innerpeffray Library and Castle were first inspected. The adjoining chapel and graveyard were also examined. Considerable interest was taken in the chapel, which is divided into three parts, the eastern division belonging to the Drummonds of Drummond Castle, the central to the Drummonds of Strathallan, and the western to Captain Drummond of Cromlix. In the eastern part the grave of the Chief of Clanranald, who was killed at the battle of Sheriffmuir, was seen. A feature of special interest was the consecration marks on the walls. The building has several points of architectural interest, the stones over the main door being hewn after a very ancient design. The corners of the old graveyard are said to have been at one time surmounted by towers. The ruins of the castle were also visited by the party, who thereafter drove to Abercainry House and grounds, and here the striking beauties of the locality were the subject of general comment. Proceeding through the estate of Cultoquhey, on which is one of the old Caledonian camps, the company were driven to Crieff, and then to the world-famed Drummond Castle and gardens and to the old Church of Muthill. It was at Drummond Castle that the Duke of Perth of 1745 celebrity resided, and the castle has been frequently visited by royalty. Queen Mary frequently visited the castle, and in the autumn of 1842 Queen Victoria and Prince Albert resided there. Thereafter the party were driven on to Muthill, where the Rev. Dr. Rankin conducted them through the old graveyard, giving many particulars regarding the history of the place. The ruins of the old church and the tower met with considerable attention.

The Princess of Wales will accompany the Prince of Wales on the occasion of laying the foundation-stone of the Deptford Fund Buildings, at Creek Road, Deptford, on Saturday morning, 2nd July.

Building Stones and Quarries of Northumberland and Durham.*

BY GEORGE T. BROWN.

THE subject of these notes refers more specially to the building quarries and stones of the counties of Northumberland and Durham, which counties are principally notable—in the building stone line—for the production of sandstone.

I have included, in a tabulated statement I have prepared, a column indicating the geological formations from which the various local sandstones are got. Now, to understand the nature and proper use of building stone, it is necessary to know something of physical geology, which deals with the origin, mode of formation, composition and disposition of rocks, and with the various changes through which they have passed, whether physical or chemical.

In geology the word "rock" denotes all the strata, whether soft or hard, which go to make up the earth's solid crust; the softest clays and loosest sands, as well as the hardest granites, are therefore included. The architect, however, is only interested where quarries are concerned with the harder rocks, which must allow of their being sawn, and worked with chisel and tools, before being put into any building.

I have on this map indicated as nearly as I can the positions of the various quarries in the two counties, by means of the black dots. Beginning at the S.E., and travelling towards the N.W., one would pass over the newer beds and reach the older beginning with the Triassic and crossing Permian (including the magnesian limestone) on to the carboniferous (containing the coal measures and millstone grit, from the former of which most of the sandstones are procured) thence on to the

* A paper read before the Northern Architectural Association.

carboniferous limestone, which is generally known in the neighbourhood as the Bernician and often called the Youdale Beds, on to the Igneous rocks of the Cheviots.

FORMATION OF SANDSTONES.—Leaving the various formations and confining ourselves to the products of the quarries, it is evident that to understand their structure it is advisable to know something of their origin.

Sandstones are composed of quartz grains which were originally laid down as sediment in the sea, not far from land, for the quartz grains of which they are composed were derived from the denudation of the land. In the first instance, the grains were no doubt obtained from the wearing away of crystalline rocks containing quartz, but the majority of the sandstones formed at later periods were largely made from the destruction of pre-existing rocks. Many sandy deposits now in process of formation, for instance, have obtained the materials of which they are made from the denudation of the sand-cliffs along our sea coasts.

Suppose we follow out the formation of a sandstone the quartz in which has been derived directly from a crystalline rock, such as granite. The felspar would decay and, being borne out to sea in the form of mud, would form clay. Part of the mica would also be removed, thus leaving the remainder of the mica and the quartz loose. These the sea would eventually seize hold of, the mica being carried away some distance from the beach at an early stage in the process, but the quartz crystals would be rolled to and fro on the beach, knocked together and broken, their rough jagged edges being worn off whilst being made into pebbles. The pieces resulting from this fracturing would be of various sizes, and the smaller pieces or grains of quartz, being small enough for the water to hold in suspension, would then be carried away from the shore. If we still follow these little grains up we shall find that as the velocity or drifting action of the water became insufficient to suspend them, they would fall to the bottom,

being quietly deposited there. It often happens that flakes of mica are deposited with the quartz, and are so arranged in thin layers that, when the sand becomes hard, it assumes a fissile character, which renders it capable of being split up into flagstones.

Little pebbles would be frequently deposited in the coarser sand. As molluscs and other organisms living in the sea died, their remains would be covered up by the deposit of sand, and unless subsequently removed, would be handed down to us as fossils. The accumulation of sand in time might become very great when the upper part of it, exerting considerable pressure on the lower, would cause it to become compact.

Although pressure alone is sufficient to make particles of sand cohere into a hard mass, yet by far the greater quantity of sandstone quarried for building purposes has a matrix or cementing material. This in most cases has been introduced into the stone after the sand has been laid down, for water, in percolating it, has left behind some of the chemicals which were held in solution, and these, forming round the grains of sand and filling up little spaces, made the mass hard—in other words, made the sand into a sandstone.

A microscopic examination of sandstone imparts a considerable amount of useful information. Then it is seen that a specimen which from outward appearance was not suspected to contain any grains but those of quartz, is made up also of minute particles and fragments of other minerals. Little opaque grains of some form of iron are frequently seen under the microscope. These are waiting to be attacked by the atmosphere, and by their decay cause unsightly ferruginous lines to run down the surface of the stone when built up. The microscope is also useful in pointing out the state of cohesion of the quartz grains, and to some extent the nature of the matrix. If, for instance, the grains are rather far apart, and the mineral calcite appears between them, the stone would not be very durable, but more so than when the carbonate of lime existed, as it very often does, in an earthy form. If, on the contrary, the small quartz grains are close together, and the little matrix at present looks firm, that is, does not present a decomposed, woolly appearance, the stone would be durable and easy to work. It would be still more durable if little veins, presenting the granular structure peculiar to chalcedony, or secondary quartz, were seen running here and there between the grains of quartz, although the more siliceous the matrix is, the more difficult the stone becomes to work up.

We see then that sandstones consist generally of grains of quartz, i.e., sand, cemented together by silica, carbonate of lime, carbonate of magnesia, alumina, oxide of iron, or by mixtures of these substances. In addition to the quartz grains, there are often other substances, such as flakes of mica, fragments of limestone, argillaceous and carbonaceous matter, interspersed throughout the mass. As the grains of quartz are imperishable, the weathering qualities of the stone depend upon the nature of the cementing substance, and on its powers of resistance under the atmosphere to which it is exposed. Sometimes, however, the grains are of carbonate of lime, embedded in a siliceous cement; in this case the grains are the first to give way under the influence of the weather.

Sandstones are found in great variety of colour—white, yellow, grey, greenish-grey, light brown, brown, red, and blue. The colour is generally caused by the presence of iron, which in its various chemical forms produces different tints. The recent fracture of a good sandstone, when examined through a powerful glass, should be bright, clean, and sharp, the grains well cemented together, and tolerably uniform in size. A dull and earthy appearance is the sign of a stone likely to decay.

WEIGHT AND ABSORPTION.—Any substance weighing less than 130lb. per cubic foot, absorbing more than 5 per cent. of its weight of water in twenty-four hours, and effervescing anything but feebly with acid, is likely to be a second-class stone as regards durability where there is frost or much acid in the air; and it may also be said that a first-class sand-

stone should hardly do more than cloud the water with Mr. Smith's test. Smith's test: Damp chippings in one-third glass of water half hour, the water agitated and the result noted.

PRACTICAL WAY OF ASCERTAINING WEATHERING QUALITIES.—The durability of a stone to be obtained from an old-established quarry is best ascertained by examining buildings in the neighbourhood of the quarry in which the stone has been used. If the stone has good weathering qualities, the faces of the blocks, even in very old buildings, will exhibit no signs of decay; but, on the contrary, the marks of the tools with which they were worked should be distinctly visible. Exposed cliffs, or portions of old quarries, or detached stones from the quarry, which might be lying close at hand, should also be examined to see how the stone has weathered. In both cases care should be taken to ascertain from what stratum or bed in the quarry the stones have been obtained.

GRAIN.—It is generally considered that the coarse-grained sandstones, such as the mill-stone grits, are the strongest and most durable. This, however, seems doubtful; at any rate, some of the finer grained varieties are quite strong enough for any purpose, and seem to weather better than the others.

THICKNESS OF LAYERS.—In selecting sandstone for undercut work or for carving, care must be taken that the layers are thick; and it is, of course, important that stones should rest in most cases on their natural beds.

USES.—The hardest and best sandstones are used for important ashlar work; those of the finest and closest grain for carving; rougher qualities for rubble; the well-bedded varieties for flags. The following qualities are necessary to ensure a good material for building purposes:—

Durability, or the power of resisting atmospheric and other external influences, is the first essential in a stone for almost any purpose.

The durability of a stone will depend upon its chemical composition, its physical structure, and the position in which it is placed; and the same stone will greatly vary in its durability according to the nature and extent of the atmospheric influences to which it is subjected. Durability also depends, to a great extent, upon the relation between its chemical constituents and those of the atmosphere surrounding. A stone which will weather well in the pure air of the country may be rapidly destroyed in the smoke of a large town. The principal cause of this decay is the action of the acids, both hydrochloric and sulphuric, in the atmosphere, and also brought down in solutions by rain and even in small quantities. The physical structure of a stone is of the greatest importance, for upon it depends greatly its power of resisting the action of the atmosphere.

FACILITY FOR WORKING.—The readiness with which stone can be converted by the mason into the various shapes in which it is required for different kinds of work is of importance from an economical point of view. The characteristics of a stone in this respect will depend in some cases upon its hardness, but will also be influenced by the soundness of its texture, by its freedom from flaws, shakes, vents, &c., and also by its natural cleavage and other ties. A soft stone of even grain and without distinct beds would naturally be selected for carved work, while a hard stone in thin layers, easily separated, would be well adapted for building good and economical rubble masonry.

HARDNESS.—The hardness of stone is often of importance, especially if it is to be subjected to a considerable amount of wear and friction, as in pavements. It is, moreover, important when the stone is to be used for quoins, dressings, and other positions where it is required to preserve a sharp angle, or "arris." It does not follow because a stone is hard that it will weather well; many hard stones are more liable to atmospheric influence than those of a softer texture, whose chemical composition is of a more durable nature. Stone used for work exposed to the action of water should be hard.

(To be continued.)

Builders' Notes.

WE understand that the statements which have recently been published to the effect that the Metropolitan Railway Company has prepared plans with a view to erecting a new station between King's Cross and Farringdon Street have no foundation in fact. It is true that the directors have power to erect a station in the vicinity should they so desire, but up to the present the question is simply under consideration, and nothing definite has been settled. One difficulty in the way of a station at the particular spot which has been suggested, viz., where the Farringdon Road and Rosebery Avenue cross one another, seems to be the great depth of the tunnel at this junction, which would necessitate the erection of lifts for the convenience of passengers.

THE Improvements Committee of the London County Council have resolved to recommend the Council to include the following schemes of public improvement in the Improvements Bill to be introduced by the Council next Session:—High Street, Kensington, widening, estimated cost £81,000; Wandsworth Road, Lambeth, widening between Vauxhall Cross and Nine Elms Lane, £55,000; rebuilding of Cat-and-Mutton Bridge, Shoreditch, £68,500; rebuilding of the Old Gravel Lane Bridge, St. George's-in-the-East, £14,000. Towards the Kensington and Shoreditch improvements the local vestries have promised contributions. The total estimated cost of six contemplated improvements, without deducting contributions, is £1,004,700; after deducting contributions, but not betterment, £955,700; and the annual charge on the rates will amount to £42,477, equivalent to a rate of .277d. in the pound. The annual charge for interest will decrease each year by £445.

MR. LANE, Q.C., the magistrate at the West London Police Court, recently heard a summons against Mr. William Henry Gibbs, a builder, of West Kensington, for preparing to lay out a street at the Hamlet Gardens Estate, King Street, Hammersmith, without first obtaining the sanction of the London County Council. Flats of a residential nature were being erected on the estate, and for the defendant counsel argued that as the street, if it could so be called, was in the nature of a courtyard, and intended exclusively for the use of the tenants, it could not be considered a highway within the meaning of the Act.—Mr. Chivers, in support of the summons, maintained that whether the street be a private one or not the provisions of the Act nevertheless applied, and he quoted the decisions of learned judges in support of his contention.—Mr. Lane, Q.C., confessed that after reading the decisions they seemed to be at variance with one another. He found for the defendant, and in dismissing the summons with five guineas costs, granted a special case for the consideration of the superior Court, at the same time advising Mr. Chivers to ask the judges to accurately define the meaning of a street.

RECENTLY, at the London Surveyors' Institution, the Metropolitan Tribunal of Appeal, composed of Messrs. A. Cates (president), A. A. Hudson, and J. Penfold, had before them for consideration an important appeal case, in which the power of the London County Council under the Metropolitan Building Act of 1894 was sought to be defined. The parties were the Lion Brewery Company (appellants) and the London County Council (respondents).—Mr. A. F. Wootten appeared as counsel for the brewery company, and the Council was represented by Mr. T. Seager Berry.—According to Mr. Wootten's opening statement, it seemed that the dispute centred around a property known as 29, Foubert's Place, Regent Street. Early in the present year plans were submitted by the architect for the Company to the Council, approval being sought for deviations from old certified plans under Section 43 of the Building Act. After keeping the matter

in hand up to May 13, the Council refused to sanction the plans. It was provided in the Building Act that if any person should desire to deviate from the plans existing, it should be lawful for him to apply to the County Council, "who shall sanction such deviation on such terms as they shall think fit to impose." He held that no one could construe the word "shall" in an Act of Parliament to mean "may."—Mr. Hudson: But surely you don't mean to say that they are bound to sanction any plans of any kind or description?—Mr. Wootten: Oh, yes, within the meaning of the Act.—Mr. Hudson wanted to know what conditions would be imposed.—Mr. Wootten: I should say you must follow out all the conditions prescribed for the domestic buildings from the commencement of this Act.—Mr. Hudson suggested that there would be no object in the Act at all if that were so.—Mr. Seager Berry, on behalf of the Council, quoted a ruling by Lord Esher, in which it was shown that the word "shall" might not always be obligatory.—Eventually the tribunal allowed the appeal, subject to the imposition of certain conditions in the plans.

THE Lancashire and Cheshire Building Trades Employers' Federation, although only brought into existence a few months ago, is already fighting the men's trade unions in about twelve different towns in Lancashire, and there is every prospect of the struggle between capital and labour in the building trade being shortly considerably extended. The Federation was established to promote and further the interests of members, and, in particular, to protect and defend those interests against combinations of workmen seeking by strikes or other action to impose unduly restrictive conditions upon any branch of the trade. It will also deal with such questions as interference with foremen, unreasonable demands for wages, employment of apprentices, hours of labour, overtime, limitation of work, and the employment of men and boys on machines. By the rules members will be recouped under certain conditions for losses entailed by reason of strikes, and legal assistance will be given when deemed desirable. The Federation will promote the formation of conciliation boards or other provision for the equitable settlement of all differences between members and their workmen. It is further proposed that the executive shall watch all legislative measures which may affect, or tend to affect, the interests of the building trades.

THE Federation consists of a union of local associations connected with the building trade throughout Lancashire and Cheshire, and such individual members as may be elected at meetings of the Federation or by the Executive Board. The latter authority have power to expel any member who, in their opinion, is acting against the interests of the Federation. This Executive Board, which manages the business of the Federation, consists of a president, two vice-presidents, and six members from Manchester, a similar number from Liverpool, and twenty-four from the rest of the Lancashire towns federated. In the future, however, associations becoming members will have the privilege of electing one out of every fifty, or portion of fifty, of their respective members to act on the Executive Board. The voting power is as follows:—Members paying, on a three years' average, not over £1000 per annum in wages, one vote; £1000 to £2000, two votes; £2000 to £5000, four votes; £5000 to £10,000, six votes; and over £10,000, eight votes. The wages of office and management staffs have not to be included in this reckoning. The annual subscription from the local associations is at the rate of 3s. per member, and for individual members £1 1s., and the executive have power in the case of strikes to impose a levy not to exceed 1s. per cent. on the average annual wages paid in the past three years. Members of the Federation have in every case of dispute with the operatives to use inquiry forms, and are not allowed to employ anyone on strike or locked out from the workshop of a member during the continuance of such strike and lock-out.

PARIS ABATTOIRS.*

BY R. STEPHEN AYLING, A.R.I.B.A.

(Continued from page xlv.)

ON the southern side of the large central market, and parallel with it, is another market for the sale of sheep (O. Fig. 1), similar in size to that for pigs and calves. Six wide roads cross the market laterally, and it is divided into pens as shown on Fig. 9. These pens are again subdivided by a number of iron posts, 1ft. 10in. high and 2in. diameter, to which hurdles can be tied, thus accommodating either a large or small number of animals. The roads are formed in granite blocks, and the flooring of pens in cement.

These three markets are similar in elevation and section, differing only in size. At P. (Fig. 1) is a large open space arranged with pens for sheep, and at Q. (Fig. 1) a "Bouverie" (stable for beasts).

At the southern end of the market, O., is a long "Abrevoir," R. (Fig. 1), or drinking pond, through which the animals pass on their way to the markets in the morning. This is illustrated by plan and sections on Figs. 10, 11, and 12. It is bounded by walls 4ft. 9in. high, along which, on either side, are platforms 2ft. wide, with handrails for the drovers. The bottom of the pond slopes towards the centre, allowing, at the deepest part, about 3ft. of water when fully charged. Drinking troughs

WEIGHING APPARATUS
IN BLOCK OF PENS FOR PIGS
FIG. 8

are also fixed on the outside of the boundary walls.

At the end of the market for pigs and calves (L.), Figs. 13 and 14, is another drinking pond, S. (Fig. 1), octagonal in shape, and bounded by walls about 5ft. high. The ground slopes towards the central divisions, allowing at the deepest part about 3ft. of water.

The building T. (Fig. 1) is a handsome stone structure of two stories in height. The rooms are grouped round two internal courts, and are devoted to offices for the various departments.

Placed symmetrically with the above is a

* This series deals with the construction of the Cattle Markets and Abattoirs of La Villette and La Rive Gauche, Paris.

building U. (Fig. 1), quite similar in design. The front portion is the Grande Salle de Reunion, a large hall, with arcading and gallery over. The back portion is used as offices for the "Regie," or city tolls.

The two small buildings V. and W. (Fig. 1) are restaurants.

On the eastern side of the market for pigs

and calves is the Parc de Comptage, X. (Fig. 1), or counting barriers for animals brought by the railway. They are similar in principle to those previously described.

Adjoining these is a small building Y. (Fig. 1), used as offices for the staff of veterinary inspectors, and another Z. (Fig. 1) for the offices of the octroi.

The small building A¹ is a slaughter house for animals condemned as unfit for food, or those of whose condition doubt exists.

This is the only slaughter-house on the south side of the canal. The animals are killed and then examined by a veterinary inspector, and passed or condemned as found necessary.

The building B¹ (Fig. 1) is used as offices for the veterinary staff, C¹ (Fig. 1) as a weighing house, and D¹ as a stable for condemned cattle and tool shed.

Between the markets and canal are a number of buildings, commencing at the northern end with E¹, the offices of the railway company.

(To be continued.)

MR. GEORGE W. WILLCOCKS, M.I.C.E., one of the inspectors of the Local Government Board, has held a public inquiry at Leamington relative to the application of the Corporation to borrow £5500 for works of water supply, and £5010 for public walks and gardens, which are already so distinctive a feature of Leamington.

The Royal Agricultural Show.

NOTES ON BUILDING TRADE EXHIBITS.

IN a sense it is inaccurate to say that the Royal Agricultural Show is this year being held at Birmingham, for the Show is at Four Oaks. But the manner is for the Show to take the name of the nearest big town and be called thereafter. Of course, for the practical part of the business the Show may be fairly described as at Birmingham, for the Midland Capital is the object of the bulk of the visitors, who may be sure that once at Birmingham they are not likely to have much difficulty in getting from there to the Show. Many of the firms exhibiting in the implement yard are showing goods of interest to our readers, and we give below particulars of some of the stands, more directly connected with the building trade:—

MESSRS. NEWTON CHAMBERS AND CO.
THORNCLIFFE IRONWORKS.

This Company has one of the biggest of the many big stands, and the goods shown are fairly representative of the variety of needs with which the well-known Thorncliffe Works are prepared to cope. Chief among the whole

PLAN OF DRINKING POND
FIG. 13

are the new "Fervent" Radiators, which are made in every variety of size so as to meet almost any imaginable requirement of the public. The sizes, in fact, run from the modest 5ft. of heating surface, to be had for 3s., up to the more ambitious one that gives 120ft. of heating surface for £18. A plentiful supply of well fitted-up cooking ranges is calculated to make one's mind turn to thoughts of lunch. It must certainly be granted that these ranges deserve every consideration. The Company has not confined its attention to the smaller kitchens, but has gone in most successfully for the big work required for asylums and institutions generally, having, in fact, now in hand a range of cooking fittings for the

UNIVERSITY OF ILLINOIS

Staffordshire County Asylum at Cheddleton. Specially noticeable was a stable fitting, on which, by the way, so as to be quite up to date, was inscribed the name of the horse to occupy the stall, "Jeddah," and in which was shown for the first time Dawson's patent ball-bearing stall fixing, the device which will infallibly prevent a horse from getting his leg over the rope, with the awkwardness consequent thereon. This stable, as shown with its fittings, is priced in the list at £66, and it was certainly in every respect complete. Other items in the exhibit were the Kingston boiler, also dome-top boilers and saddle boilers, and portable furnace boilers. The more directly agricultural element was, of course, specially to the front, with various garden rollers, vases, seats, etc., altogether making a most effective and representative display.

MESSRS. G. F. BRAGGINS AND CO., OF BANBURY.

A very striking and attractive stand is that of this firm, who show several handsome gates for farm and park. The variety of design and substantial workmanship are alike excellent, and there is a rural suggestiveness about the exhibit that one misses in many other stands, even where it would appear to be most inevitable.

MESSRS. TANGYES LIMITED, BIRMINGHAM.

Petroleum engines are the main feature of the stand of this Company, and a very imposing stand it is, occupying a large amount of space, and extending to a considerable depth. Gas engines are also shown in great force, and the welcome legend "Sold" on not a few of the engines testifies to the success of the exhibit.

THE CANNON HOLLOW WARE COMPANY LIMITED.

The Sanitary Department of this Company is less strongly shown than it deserves, but at an agricultural show this is easy to understand, and the general merit of the exhibit is not small. The grindstones of the Company are the main feature, and there are about two dozen of these in various sizes. Several specimens of the Company's "Porseliron" ware are displayed.

MESSRS. WEYMAN AND HITCHCOCK, CHELTENHAM.

The "Trusty" Oil Engine is shown at Stand 372, and is well displayed. The small portable engine just outside the stand makes itself heard as well as seen, and the rest of the exhibit is carefully explained by a staff from Cheltenham, whose courtesy is fully equal to all the traditions of the Show, and who are in sufficient numbers to cope with almost any number of visitors that are likely to be at any one stall at the same time. The Company's catalogue gives the results of trials specially made of these engines some time ago by Mr. Beaumont, from which it appears that the cost of working the engine was about one-third of a penny per hour per indicated horsepower. There are also shown at this stand some of the Company's gas engines.

MESSRS. G. AND F. COUZENS, CARDIFF.

This firm's well-known patent traps and tidal interceptors are shown at Stand 219. We have several times drawn attention in the Journal to these excellent gully traps, and it is enough to say that the stand was receiving considerable attention from the visitors at the Show. The claim of the patentees that by the use of these traps the back-flow of water and sewer-gas is prevented was vindicated, and the method explained, by Mr. Couzens himself.

MESSRS. JOHN S. MILLAR AND SON, ANNAN.

The "Ideal" Windmill of this firm, which has been in full use in many of the largest estates in the country for years, is so shown at the Show that he would indeed be a blind man who failed to see it, perched up on the top of one of the steel towers of the firm's make. It is doing excellent work, and, although at the time the writer saw it there was little or no breeze, the mill, nevertheless, was not by any means idle. A 6ft. wheel, 50ft. high, costs £25.

MR. ANDERSON, the contractor for the deepening of the Buckpool Harbour, is pushing on the work, between 80 and 100 cubic yards of material being removed daily from the bed of the inner basin. There are already nearly 5000 cubic yards removed, and the work has been nine weeks in hand. The material is chiefly loosened by blasting, and is being carted to the west end of the harbour to form reclaimed ground.

A REPORT from the Bristol Sanitary Committee refers to complaints made of the practice of discharging refuse dredged from the harbour into the river through the underfall sluices, and recommends that the Docks Committee be instructed to arrange for discharging the dredgings into the Bristol Channel during the months of July, August, and September, when there is a scarcity of water in the New Cut. The additional expense is estimated at £1000. The committee further recommend the leasing of a portion of land at Barton Hill for a Sanitary Authority depot.

A CORRESPONDENT signing himself "A. J. R." writes:—"Our municipal and parochial authorities are not without a sense of humour, although the dwellers in the west of London consider the latest specimen thereof to be a *mauvaise plaisanterie* indeed. The present week is the one selected out of the fifty-two weeks of the year for the repair of Belgrave Square, which at this moment presents for many yards a surface of jagged stones. Surely the stupidest official must know that Belgrave Square contains more traffic in June than in January—perhaps it is because he knows it that he causes costly carriages and valuable horses to do the work of his steam-roller. In Lower Belgrave Street also the same intelligence has been displayed. After allowing the street to become absolutely dangerous for want of repair, the authorities mended it thoroughly about two months ago, and now they have just dug half-a-dozen big holes in it in the process of putting in some new drains, and to-day somebody is running a trench right up the middle of it."

Surveying and Sanitary Notes.

For forty years the Shrewsbury Town Council have been discussing one scheme after another for improving the water supply of the town, and the difficulties in the way seem as insurmountable as ever. The last scheme was to pump the water from the Severn from a higher point than at present, and to filter it, which is not at present done. The cost of the works was estimated at £48,000, and when an inquiry was held, which resulted in the Local Government Board condemning the scheme on the ground that the Severn water, even when filtered, was "highly suspicious," a committee of the whole Council was appointed to consider the next step, and at their meeting Alderman the Hon. W. H. Herbert reviewed the whole question, and proposed that the Local Government Board be asked to receive a deputation from the Council to consider the matter, with the view of coming to some solution.

BEFORE the stipendiary (Mr. Harold Wright) and other magistrates, at the Hanley County Police Court, Richard S. Topham, of London Road, Forest Hill, E.C., the owner of ten cottages known as "Topham's Row," in Bucknall, was summoned under the Housing of the Working Classes Act, 1890, for allowing the houses in question to be in a state so dangerous or injurious to health as to be unfit for human habitation.—Mr. Charles Daniel, Clerk to the Stoke Rural District Council, who prosecuted, said the object of the prosecution was to obtain a closing order in respect of these houses, which were in a wretchedly dilapidated and insanitary state. Four of them were at present untenanted and dismantled, but the other six were occupied, though all were totally unfit for habitation. On March 7th the defendant was served with notice to put the property in repair within two months, and the period was afterwards extended by another month, but nothing had been done.—The stipendiary made an order for all the houses to be closed, and imposed a fine on the defendant of £5 and costs in respect of each case—£56 19s. in all.

A RECENT number of the Ceylon Observer shows that up to the end of 1897 the total expenditure on the Colombo Harbour works amounted to Rs.17,875,355, of which Rs.5,529,916 have been incurred on the two additional breakwaters commenced in 1894. Before the completion of the works, which comprise a graving dock and patent slip, a coaling depot, and the three breakwaters enclosing a harbour of one square mile in extent, the total outlay is expected to reach Rs.2,500,000. The sterling debt of the colony on account of these harbour constructions will be £1,300,000. It will probably be 1902 before everything is finished. If the tea industry continues to flourish the prosperity of the harbour income is assured. If it does not, there might be a serious falling off, although the Colombo harbour and dock, owing to their central position, will always possess an international and Imperial importance.

PROPERTY & LAND SALES.

HAMPTON and SONS beg to announce that their AUCTIONS of LANDED ESTATES, town and country Residences, Investments, Business Premises, and other Properties, are held MONTHLY at the MART, Tokenhouse-yard, E.C.

Auctions can also be held on other days, in town or country, by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.

June List of Estates, town and country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to Hampton and Sons (Ltd.), 1, Cockspur-street, S.W., or by post, three stamps.

Auction and Estate Offices, 1, Cockspur-street, Pall Mall, S.W.

FINCHLEY ROAD.

Occupying a pleasant position in this favourite residential locality, close to Marlborough-road Station, with frequent service of trains to the City and West End, and within a short drive of Regent-street.

The conveniently placed, double fronted, detached Family Residence and Stabling, known as Bishop's Lodge, 35, Finchley-road, N.W., substantially built, and standing well back from the road, approached by a carriage-sweep. Held for 39 years unexpired from Michaelmas next, at a ground rent of £20 per annum. Possession on completion of the purchase.

Also the Two well-placed and attractive, semi-detached Houses, Nos. 5 and 15, Finchley-road, N.W., each containing six bed rooms, bath room, three reception rooms, conservatory, and usual domestic offices. No. 5, Finchley-road, is let upon a five years' lease from September, 1897, at £90 per annum, thus forming a good investment. Both held on lease, having an unexpired term of about 23 years, at a ground rent of £11 per annum each. Vacant possession of No. 15 on completion of purchase.

HAMPTON and SONS will SELL the above by AUCTION, at the Mart, E.C., on WEDNESDAY, JULY 13, 1898, at 2 o'clock, in three lots (unless previously disposed of by private treaty). Detailed particulars and conditions of sale can be had of Messrs. Foss and Leddam, Solicitors, 5, Fenchurch-street, E.C.; and of the AUCTIONEERS, 1, Cockspur-street, S.W.

Close to railway stations on L. and N.W., Midland, Met., and N.E.; also bus routes to City and West-end.

MR. LEOPOLD FARMER will SELL by AUCTION, at the MART, E.C., on WEDNESDAY, JULY 27th, 1898, at Two o'clock, the following:—**WEST HAMSTEAD.**—With possession.—3, Sherif-road, West-end-lane.—Freehold detached Residence, having five bed and dressing rooms, bath, two reception rooms, conservatory, usual offices. No basement.—Solicitors, Messrs. Fytche, Field, and Baker, 23, John-street, W.C.

ST. JOHN'S WOOD.—With possession.—117, Alexandra-road.—Long Leasehold Residence, having six bed and dressing rooms, bath, three reception rooms, usual offices. Good garden.—Solicitors, Messrs. Yeo and Co., 41, Finsbury-pavement, E.C.

Particulars and conditions of sale at the Mart, E.C.; the respective SOLICITORS; and the AUCTIONEER, 46, Gresham-street, E.C., and Kilburn, N.W.

Little Ilford, within a few minutes from East Ham, Ilford, and Manor Park Stations.—Fourth Auction Sale.

THE PREMIER LAND COMPANY

(Limited) having sold every lot at their previous auction sales, will SELL by AUCTION, at the PUBLIC HALL, Plashet-grove, East Ham, on WEDNESDAY, JULY 20th, 1898, at 7.30 in the evening precisely, 120 valuable FREEHOLD PLOTS, including frontages to Rectory-road and Elsenham-road, also valuable shop plots in Church-road. No title or land tax. Payment by instalments, spread over 4½ years, if desired. Possession on payment of deposit. Free conveyances. The new roads are formed and kerbed, and have separate sewers and surface water drains.—Particulars, with plan and conditions of sale, may be obtained, when ready, at the place of sale; the principal hotels in the neighbourhood; of the PREMIER LAND COMPANY (LIMITED), 10, New Broad-street, E.C.; Messrs. TAYLOR and TAYLOR, Solicitors, 10, New Broad-street, E.C.; or of Mr. H. A. RAWLINS, Surveyor, 45, Queen Victoria-street, E.C.

HILL PARK ESTATE, Westerham, Kent, twenty miles from London, 500ft. to 700ft. above sea level.—FREEHOLD choice BUILDING SITES for SALE on this rising, high-class residential estate, from one acre and upwards. Chalk subsoil; magnificent views. Also excellent, well-built Residences to be Sold or Let. Rents from £50 to £250 a year. Water supplied by the West Kent Water Company. Fast through trains to and from City daily.—Apply to the RESIDENT AGENT, on the Estate.

LAND, for the erection of Residences, in the choicest part of Surrey, on the hills, beautifully timbered, with convenient railway access.—PLOTS, varying from one to twenty acres, to be LET or SOLD, for building purposes.—Apply WEATHERALL and GREEN, Surveyors, 22, Chancery-lane.

TO BUILDERS.

The Freeholder of a large suburban Estate (S.W.) wishes to meet with ONE or TWO BUILDERS accustomed to building good-class suburban property of from £60 to £120 a year rental. Main road, prettily wooded sites for houses. Plenty of ground to each plot, several having tennis lawns; main drainage; cricket and tennis clubs and three golf courses within a mile. Eight miles from Royal Exchange. Some shop plots adjoining railway station on main road. The land will be sold or let with restrictions, and advances can be had. Unquestionably one of the best things going at the present time for the right man.

Freeholder's Surveyors and Architects, Messrs. CHESTERTON and SONS, 51, Cheap-side, E.C.

Important Sale of Building Land, Shop and House Property, and short Leasehold House and Stabling, for occupation.

C. RAWLEY CROSS and CO. will SELL by AUCTION, at the MART, Tokenhouse-yard, E.C., on MONDAY, JULY 4th, at TWO o'clock, the following:

VALUABLE BUILDING SITE, having a frontage to Uxbridge-road, Shepherd's-bush, of about 266ft., and to Old Oak-road of about 250ft., ripe for the erection of ten detached or semi-detached residences, with long gardens, for which there is a great demand. Held on lease direct from the Ecclesiastical Commissioners, at a nominal ground rent of £2 per annum.—Solicitor, GUY ELLIS, Esq., 11, Lincoln's-inn-fields, W.C.

Unusual opportunity of acquiring a high-class Marine Freehold Residence at Bognor-on-Sea.—Purchasers need only pay a deposit of 10 per cent., the balance by half-yearly instalments extending over nine years.—The imposing House, No. 2, Park-terrace, in an exceedingly pleasant position on the esplanade, facing the sea. It contains eight airy bedrooms, four spacious reception rooms, and ample domestic offices. Suitable for a high-class boarding house. Also Freehold Houses, 3 and 4, Lansdown-place; let at £65 and £70.

MR. GEORGE F. HARRINGTON will SELL the above by AUCTION, at the MART, London, E.C., on JULY 26th, at TWO, in three lots.

Particulars of W. J. MYATT, Esq., Solicitor, 23, Abchurch-lane; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

By order of the Trustees of the late Robert James Chaplin, Esq.—Catford.—To Builders and others.—10a, or 18p, of Freehold Land, situate in a first-class position, with possession at Christmas next, when part will be available for building, having existing frontages; also a Freehold Ground Rent of £30 a year, secured on residences, in the same neighbourhood, which will be Sold by Auction by

MR. GEORGE F. HARRINGTON, at the MART, E.C., on JULY 26th, at TWO, in two lots.

Particulars of Messrs. BADHAM and WILLIAMS, Solicitors, 3, Salter's Hall-court, E.C.; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

MESSRS. GREEN and SON, AUCTIONEERS and SURVEYORS, 23 and 29, St. Swin's-lane, London,

Beg to announce that their SALES by AUCTION of FREEHOLD, LEASEHOLD, and COPYHOLD PROPERTIES, Ground Rents, Life Policies, and Reversions take place at the MART on the LAST FRIDAY in the MONTH, and on such other occasions as may be arranged.—Particulars are invited 21 days prior.

MESSRS. GREEN and SON undertake SURVEYS and VALUATIONS of LAND and HOUSE PROPERTIES, as well as Machinery and Plant, for

Ratings, Compensations, Partnerships, Assessment Appeals, Estate Duties, Dilapidations, Fire Losses, Mortgages, and other purposes.

Estates managed and rents collected under Receiver-ship and other powers.

MESSRS. GREEN and SON invite the attention of persons requiring money on mortgage to their

MORTGAGE LIST, founded in the year 1853 (entered at Stationers' Hall), which contains particulars of sums of money in the hands of trustees and solicitors by whom they are instructed to obtain securities.

Auction, Land, and Estate Offices, 23 and 29, St. Swin's-lane, E.C.

SUTTON, SURREY.—FREEHOLD BUILDING LAND for SALE, in cheap lots. Practically no restrictions. Roads made, gas and hot-water laid on. Free conveyances. Any sized plots. Payment by instalments if required.—Brooks and HELLER, 8, Old Jewry, E.C.

MESSRS. FORTESCUE and BRANSON have received instructions to SELL by AUCTION, at the MART, Tokenhouse-yard, E.C., on MONDAY, JULY 4th, 1898, at two precisely:

The four long Leasehold Dwelling Houses and Laundries, known as 6, 20, 22, and 24, Wendell-road, Shepherd's Bush. Let and producing £180 per annum, tenants paying rates and taxes. Held for long terms at moderate ground rents.—Solicitors, Messrs. Church, Rendel, Toild, and Co., 9, Bedford-row; and Messrs. Ford, Lloyd, Bartlett, and Co., 38, Bloomsbury-square, W.C.

By order of the Executors of the late Mrs. Shepperson.—A charming double-fronted Residence, with room to erect a stable at the rear, known as 17, Rylett-road, Ravenscourt Park. Let at £60 per annum. Held on a long lease, at a moderate ground rent.—Solicitors, Messrs. Fearless and Sons, East Grinstead.

Particulars and conditions of sale of the respective SOLICITORS; at the Mart; and of the AUCTIONEERS, 54A, Goldhawk-road, Shepherd's Bush, W.

HIGHEST AWARDS.

ALBION CLAY COMPANY LIMITED.

SOLE MANUFACTURERS of the

"GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "Granitic Stoneware" Pipes are made from "Stoneware" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** purposes. The Pipes have a "toughness" as opposed to "brittleness," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "Granitic Stoneware," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked

All sizes to 24in. diameter of full Standard thickness, and of any length up to 3ft. for 6in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM

PERSPECTIVE VIEW

LONGITUDINAL SECTION THROUGH C.D.

SECTION THROUGH

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage and Drainage** according to circumstances, the **Patent Paragon Pipes** are made in **three** forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c.; (B) With **deep** Sockets for **Sewers and House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying**, the Name should always be given in full, as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious and imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made Watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by ordinary Pipe-layers. Bends and Junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Water-logged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.

JONES & SYKES' PATENT CHANNEL BENDS FOR MANHOLES AND INSPECTION CHAMBERS.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket to hold Detritus. Cannot untrap.

KEITH'S PATENT DRAIN TESTING AND FLUSHING TRAP. Simple in Construction, efficient and reliable.

SYPHONS, GULLIES, INTERCEPTORS, &c., with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap and fitted with **SYKES' Patent Screw Stoppers**.

INVERT, JUNCTION, and GULLY BLOCKS, STREET GULLIES to any size. **LATRINES, CLOSETS, SINKS, &c.**

Works: **WOODVILLE, BURTON-ON-TRENT.**

CHIEF LONDON OFFICE: **18, NEW BRIDGE STREET, E.C.**

LONDON DEPOT: **MIDLAND RAILWAY (Somers Town Goods Station), OSSULTON STREET, EUSTON ROAD, N.W.**

An Architectural Causerie.

The Principles of Art.

ANOTHER contribution to the swiftly-growing mass of Ruskinian literature is made in Mr. William White's "The Principles of Art." The book aims at providing, for the use of students and the art-loving public (to use a consecrated phrase), a connected commentary, drawn from the writings

of self; and we are left to wonder, not at the mistakes of the book, but at the amount of research and the deftness of the literary carpentry displayed by its author. To the present and to the coming race of students, no less than to a large section of the public, the book should be valuable, if only in this, that in one admirably printed volume we have a précis of Mr. Ruskin's whole teaching. By reviving interest in the matchless prose, it should send men back to the Ruskin worshipped in youth, though forgotten in the whirl of work in later life. The chief defect in the work is that found in all collections of extracts. The illustrative passages relating to the various artists represented in the museum lose much of their value and interest by being torn from their settings. We lose the sense of proportion, of balance, the rise and fall of interest. The cunningly contrived climax fails of its chief effect when torn from its proper place. Yet, as a guide to the museum

thusiasms, have now been so absorbed by the thinking public, that his evangel has become part of our intellectual life, and we are in danger of forgetting the magnitude of our debt to one who has done so much and sacrificed so much for Art and Literature in England. Mr. White's book therefore is welcome in that it recalls us to our allegiance, and reawakens our gratitude to the most strenuous and influential critic of modern times. H. W.

The People's Bible.

"I say, if you do not feel the beauty of the little gray cottage, which has stood so many storms and evil days, and is still sound and trim; or of the little village church, brimful of the history of six centuries, you cannot feel that of the stately cathedral."—It may not seem amiss, now that Mr. Ellis's address on the life-work of

of the master himself, on the collection in the Ruskin Museum at Sheffield. Those comments, admirably applied and carefully chosen, are strung together by Mr. White's own observations, the result of years of study of the master's writings and their subjects. This is obviously a most difficult, indeed a perilous, enterprise, one needing much enthusiasm and unwearied industry to carry through. The dangers are many and obvious, yet Mr. White has escaped most by a sup-

and a witness to the master's influence, the book could hardly be better. Its purpose is helped by many admirable illustrations, and by the sensible classification of works into schools and styles. Exception may be taken to the use of the term "Art prophet" adopted, though not invented, by Mr. White. It is in no sense applicable to Mr. Ruskin. His genius is surely that of critical interpretation, not prophecy in either sense of the word. His interpretations, his poetic en-

his most intimate friend has been published, to make a few extracts from one of William Morris's latest discourses. (An address delivered at Birmingham, 1894.) And it is well that this short paper should be written to-day, if at all, for we would have everyone know that this, from Kelmscott type, although produced at a price which seems little is yet as perfectly printed as any that came before. There remains, it appears, in the hands of the trustees, the matter of several

lectures, which Messrs. Longman and Co. have undertaken to publish. Whatever conditions were made, the result makes it clear that the parties concerned have desired to put within reach of Morris's public not merely the words of his lectures, but one example at least of his art. There was never a thought of profit in the work of the Kelmscott Press. It is true that the books were expensive, but whoever has called them dear has known nothing of what they have cost. The most that Morris could do in his lifetime was to conclusively prove, by producing examples, that the crafts, one and all, are intrinsically worthy of the love he bestowed upon them. He set up a standard, in short, in this and the other arts, and did so regardless of cost. His lectures, if we are not mistaken, will be cheaper even than this by-and-bye, but as the jewel gains by its setting, there will always be many who will prefer if they possibly can to have his works in this generous form. For here, for half-a-crown only, have we the original type. Its position on the page allows marginal spaces for private love-labour, and the paper will tempt both binder and artist. What Morris said about art was perforce repeated so often, and was moreover so perfectly true, that the mere maxims enunciated are likely in time to become commonplace, but we seem as we read to hear him speak of his love of our country, and in the glimpses we get of this man lies much of the charm of the lectures. There are passages here in abundance which alone would be worth reprinting, but fortunately so inwoven with the thread of the same discourse, and so essential to our dream-picture—the picture memory paints—that we ask for the whole or nothing. "Now perhaps you will say that, even so far, I have not been speaking of the simple unblended work of Nature. That is true." In all old civilised countries, even when we are in the country, out of sight of a single house, the aspect of the place is largely influenced by the work of man: the hedgerows, the road, the lanes leading out of it, the trees which have all been planted by men's hands, the growing crops, the tame beasts and sheep, the banked and locked rivers, all these go to making up the loveliness which lies before us. But, besides all that, it is seldom in England that we can be out of sight of a house, never out of memory of one seen but a little while ago. So here we are brought at once to that transition between works of Nature and of Art, wherein each plays its own part, and which, when they are happily harmonised, produce the greatest pleasure that the eye can have, and appeal most directly to the imagination. For in these landscapes, which include building, we have before us history in its most delightful, and even, I will say, its most instructive, shape. And furthermore, in such landscapes England (in all countrysides which have not been ruined by our artificial poverty) is fruitful; for both the circumstances of life in the Middle Ages in England, and the genius of our forefathers, led them specially to what I should call the embroidery of the general face of the country. If we lacked, as we did, the romance of the great walled towns of the Continent, we had as a compensation abundance of ancient villages, with their small but beautiful churches, full of individuality and character, and their generously built manor houses and homesteads, which, between them all, once made an English countryside a special treasure not to be seen anywhere else." E. R.

A new post office in Perth has just been opened.

The Bishop of London last week performed the ceremony of laying the foundation stone of the new Church of St. Simon's, Peter's Park, Paddington. The church, when erected, will seat 600 people, the cost being £4500.

STAIRCASES.

MODERN Domestic Architecture is more remarkable for utility than for picturesqueness; and the poet who wrote of the "long unlovely street" might even more justly have spoken of the "tall unlovely blocks of flats" which are now to be seen on every hand. As the external embellishments of the old sixteenth and seventeenth century houses—the gables, the wings, the picturesque groups of chimneys, are sternly banished from our present day abodes (where the architect's chief ambition appears to be that of squeezing as many human beings as possible into one given space, as the honey cells are fitted into a bee's comb); so many of the space engrossing but attractive internal structural arrangements of days of yore have vanished from modern mansions. The huge stone well which contains the stairway of a block of flats, or the

MEAN NARROW FLIGHT OF STEEP STEPS

which represents, says the *Globe*, the staircase of many an expensively-rented London house, cannot be compared with the massive picturesque structures by which our ancestors, a couple of centuries or so ago, ascended to the upper chambers of their abodes. The staircase of an ancient house was often its most picturesque internal feature, and one which irresistibly tempted an artist's pencil. It occupied the centre of the mansion, and was built with lavish disregard of space. Its broad low steps and spacious landing-places were bordered by heavy railings and balustrades, carved and wrought with elaborate skill; sometimes adorned with groups of figures at the turning places. Winding gently round and round, this staircase led up to the top of the house by so easy an ascent that it was not difficult to credit the family tradition of how a fox-hunting squire of the last century had, for a bet, ridden his favourite hunter up and down these broad, shallow steps.

FROM HALL TO ATTIC.

Nearly every old house of any pretensions has a staircase of this description; and there are specimens still lingering even in the metropolis itself. Comparatively few persons know that what may be called "an historic staircase" is still existent in the house which Sir Joshua Reynolds once occupied near Leicester Square. If that strongly-made ancient stairway, with its balustrades and its broad low steps, could only enumerate the celebrities who must have ascended it to reach the studio of the famous eighteenth century painter! Up it Johnson must often have rolled; doubtless holding on firmly to the strong low banisters. Angelica Kaufmann's light steps have tripped over those old boards again and again; Garrick—most perplexing and difficult of "sitters"—Mrs. Siddons, all that galaxy of fair women and famous men whose faces still look down upon us from Sir Joshua's canvases, have, in turn, passed up the sturdy heart of oak structure, which remains as firm as ever; although its original makers and users have long ago passed away.

The bust outlasts the throne,
The coin, Tiberius.

According to Charles Lamb, an old house in Norfolk boasts a haunted staircase, in the mansion traditionally occupied by the Wicked Uncle of the "Babes in the Wood," up and down which the ghosts of the murdered children flit at midnight. Is this legend founded upon the true story of that small hidden stairway of the Tower of London; under which, some two centuries after their murder, the bones of Edward V. and his child brother were discovered? There are two distinct descriptions of staircases in old houses. One, the grand, the principal, built of wood or stone, and forming a conspicuous feature and ornament of the mansion. Staircases like these are found at Haddon Hall and similar "stately homes of yore," and are selected by many an artist to illustrate passages in a romance or a poem: as in the case of one edition of Longfellow's works, where the "Old Clock on the Stair" is represented as occu-

pying one of the corners of an ancient staircase landing while on the stairway itself

Groups of merry children played,
Youths and maidens dreaming strayed.

Staircases like these seem associated with all the events of family life; with gambolling children, with happy-faced young folk tripping lightly over their dark boards; with wedding days, when the bride, "crowned with blessings," lingers a little as she passes, for the last time in her maiden life, down the shallow steps of the old staircase, and out from the family roof-tree; with merry parties of youthful descendants, grandsons and granddaughters, racing gaily up the old steps, and pausing to admire the quaint carving of the banister, where the family crest and motto figure upon oaken shields, or grim figures of beasts or men grin at the landing corners. And even the occasional passing of a "funeral train" down that old stairway may link the old structure with some tender memories. But the "escalier dérobé," the back staircase,

THE SECRET STAIRWAY.

has neither pleasant nor affectionate associations connected with it. That narrow, winding flight of stairs (usually of stone), which is almost invariably an adjunct of the "grand staircase" of an important old house, has nothing but mean, sordid, and even discreditable traditions attached to it. Its most respectable use was that of the common domestic service of the house. It is always up a "secret stairway" that the villain of fact or fiction proceeds to his evil works. It was one of the least attractive peculiarities of

OLD-WORLD ARCHITECTURE

that most antique mansions possessed one or more of these concealed stairways; which were craftily contrived to give admittance to rooms apparently secured against all intrusion; so that the unsuspecting owner of the mansion might walk tranquilly up his grand staircase, and bolt and bar himself, with fancied security, into his private apartment; all unaware that the villain was stealthily flitting up some hidden flight of stairs ending at a door concealed behind arras, or curtain, or picture, or panel, which opened direct into his victim's private chamber; whose occupant the villain (thanks to the "escalier dérobé") could now rob or murder at his ease, and depart as discreetly as he came. There are many old staircases which are rich in historical associations. Who can forget the "Giant's Stair" at the Doge's Palace in Venice, down which the head of Marino Faliero is said to have been thrown after his decapitation; or the "Scala Santa" at St. John Lateran at Rome; or the many other

FLIGHTS OF SACRED STAIRS.

which (like those of the "Scala Santa") are only to be ascended upon the knees. The worn flight of stone steps at Canterbury Cathedral is but little changed since the days when Erasmus and Colet watched the crowd of devotees, at the shrine of St. Thomas, painfully scrambling up it in this fashion; for, some three centuries having elapsed since pious knees thus "wore away the stones," it has not been necessary to protect them from attrition with "a stout wooden cover," as Mrs. Trollope, writing in 1841, records had been done to the Scala Santa. Gloomy and terrible are the associations connected with the stairways of many an ancient castle; the narrow-winding turret stairs, up which many a desperate fray has been waged, when "one man held the stair against a host;" or the dark slippery steps which led to the dungeons and the oubliettes. These descriptions of staircases may be "missed without being mourned."

A MASONIC service has been held in Rochester Cathedral with the object of raising funds towards £5000 which is required for erecting a new tower to the cathedral. The cathedral was built by Freemasons, and the original tower, the Architecture of which is still preserved, differed widely from that of the present square tower, erected in 1827. The Dean desires to restore the original design, which shall perpetuate what he considers to be the true architectural taste of the early Masons.

THE NORTH FRONT PENSHPURST

PENSHPURST PLACE.

BY H. INIGO TRIGGS.

THE great Kentish shrine of Penshurst Place is a large and straggling collection of buildings, dating from far back before the time of William the Conqueror, for we learn that in feudal times a fortified house occupied the site of the present buildings, and for two centuries afterwards the manor descended from father to son in the family of the de Penchesters.

In the south chancel of the church there still remains a battered monument to Sir Stephen Penchester, who was buried there in the reign of Edward I.

The manor then passed to Sir John Pulteney (the founder of St. Laurence Pulteney Church, E.C.), who had married the heiress of the de Penchesters. Sir John obtaining permission to "crenellate" in 1341, built extensively, and to him we owe the great hall, undoubtedly one of the finest specimens of a Baronial Hall extant, one glimpse of which gives a more vivid picture of life in the middle ages than any written description. We see it now, as tradition says the Black Prince saw it in a sojourn at Penshurst with the Fair Maid of Kent.

Sir John de Pulteney died without male heirs, and Penshurst passed to Sir John Devereux, who commenced adding a long wing to the house in the time of Richard II. (afterwards finished by the Duke of Buckingham and named "Buckingham Building"). After changing owners frequently, and being successively owned by John, Duke of Bedford, and Humphrey Stafford, Duke of Buckingham, the estate was given by Edward VI. to Sir William Sidney, and so commence the most conspicuous records which rank its eventful history.

The next owner of Penshurst was Sir Henry Sidney, who married Lady Mary Dudley, sister of Queen Elizabeth's favourite, and this alliance is recorded in the buildings by the use of the Dudley arms, the Bear and Ragged Staff, as an ornamentation on the screen in the great hall. Sir Henry fortunately escaped the conspiracy which proved so fatal to many of Lady Mary's relatives for placing Lady Jane Grey on the throne.

About this time was born at Penshurst a Statesman destined to figure so prominently in the politics of his day—Sir Philip Sidney, "the idol of his day." At the early age of 18 he was attached to the English Embassy at Paris, and was made a baron of France by Charles IX. Later in life he wrote his celebrated *Arcadia*; he was knighted in 1583, and in the same year married Frances Walsingham; two years later, having been appointed Governor of Flushing, he bade farewell to Penshurst, destined never again to return, for some months later at the Battle of Zutphen that touching incident occurred, which showed the noblest side of the great man's character, who, when grievously wounded, could give up the water which his

fevered lips so longed for to a dying soldier stretched out on the ground beside him, uttering the memorable words: "Thy necessity is greater than mine." After many days of severe suffering he died at Arnheim on October 7th, 1586. His body was conveyed to England, and, after lying many days in state was interred in old St. Paul's Cathedral. Of Sir Philip Sidney, Southey wrote:

Tread
As with a Pilgrim's reverential thoughts
The groves of Penshurst. Sidney here was born,
Sidney than whom no greater, braver man
His own delightful genius ever feign'd,
Illustrating the groves of Arcady,
With courteous courage and Royal love.

At Sidney's death Penshurst passed to his brother Robert, created Viscount Lisle, Baron Sidney of Penshurst, and later (1618) Earl of Leicester, who married Barbara Gamage. Algernon Sidney, the second son, early in life joined the Parliamentary forces as a Colonel, and distinguished himself at the battle of Marston Moor; he was, however, opposed to the policy of Cromwell and fought only for liberty. After a life of varying fortune, seventeen years of which was spent in exile, he was finally beheaded on Tower Hill in 1683. The estate, after being successively in the hands of the sixth and seventh Earls of Leicester, passed to a Mr. Percy, who married Elizabeth Sidney, the heiress of Penshurst, and by marriage went to Sir Percy Bysshe Shelley, the ancestor of the present owner, Lord de l'Isle and Dudley.

The north front and central gatehouse, through which we enter from the park, was built by Sir Henry Sidney in 1585, the wing to the left on entering was rebuilt in 1834, that on the right is Elizabethan restored. The restoration here and elsewhere has been admirably carried out, the present owner being scrupulously careful of the old buildings; over the entrance gateway are the arms of Edward VI., who gave Penshurst to Sir William Sidney, and over this is a tablet, the inscription on which states that Sir William's son and successor, Sir Henry Sidney, in 1585, caused the gatehouse to be erected to the memory of his father's patron.

Passing through the gatehouse we emerge into a small court surrounded by buildings on three sides. Immediately in front of us is the old Baronial Hall, perfect in its unrestored state; it was erected by Sir John Pulteney in 1341. The bold arches ranging above the windows from buttress to buttress greatly improve the exterior architectural effect, and at the same time add strength to the main walls. Entering through a fine vaulted porch and doorway, the jambs of which are ornamented with a chain of quatrefoils, we find ourselves under the minstrel gallery, erected by Sir Philip Sidney. The gallery is blackened by the smoke of ages, the central octagonal hearth, dating back to the days of Sir Henry Sidney, with its massive oak logs, carries one's imagination back to days when Yule Tide was kept up in good old fashion. In the roof immediately over this hearth there existed,

until about half a century ago, a louvre, through which the smoke escaped, a fashion continued in buildings of this kind long after the introduction of chimneys. The roof is a very fine example, open to the ridge, with boldly moulded ribs, purlins, and cornice. The principals are supported from just below the cornice by full-length grotesque figures, rudely carved, all of which, from some reason, have had their legs amputated. Beneath the Minstrel Gallery, in the west wall, are three arched doorways leading to the kitchen, buttery, and servants' hall, and at the south side of the screen is another porch, added by Sir Henry Sidney on Pulteney's big buttresses.

The Minstrel Gallery screen itself has had plaster tracery inserted into its panel heads, doubtless the work of last century; above, behind the gallery, is some fine panelling. Much of the wainscot in this portion of the house is of split oak, untouched by the plane. A door at the north of the gallery leads into a suite known as "Saccharissas Rooms," after the beautiful wife of the Earl of Sunderland, who made frequent use of these apartments in her many visits to Penshurst.

On the south side of the dias an octagonal stone staircase leads to the state dining room, and thence to Queen Elizabeth's room and the Buckingham building, all richly hung with tapestry, and containing many interesting family portraits. The furniture is especially fine, and is mostly of sixteenth and seventeenth century date. The fireplaces have quaint cast-iron backs with hunting and warlike scenes; from the state dining room a slit in the wall gave the lord a full view of the hall, and enabled him to regulate the merriment of his retainers below. There are interesting relics of Queen Elizabeth, including a worked table said to have been by the Queen herself, and a cabinet, formerly in the possession of Cardinal Wolsey; amongst other pictures is a quaint scene of Queen Elizabeth dancing with Robert Dudley, Earl of Leicester; and in a small page's closet adjoining is a rare and valuable collection of old china.

In the entrance corridor on the ground floor is a fine collection of old armour, containing several complete suits, together with some muskets of very early make. The remaining portion of the house is devoted chiefly to private apartments.

Possibly one of the greatest of Penshurst's many attractions are the delightful old Elizabethan gardens which stretch away with steps and terraces to the park beyond, with grass walks winding in and out among flower beds, yew hedges, and mysterious alleys, leading us to little bowers, where the sound of trickling water is heard, and presently a tiny silver stream peeps forth among the ferns, and entices us to rest in the cool shade by its side.

Through a private gateway we enter the churchyard, the grey old church tower rising above the dark green yew hedges, whilst beyond the lych gate, flanked by picturesque old cottages, forms a delightful subject for the artist's brush.

Bookshelves in Minstrel's Room

PENSURST PLACE.

ENGLISH CATHEDRALS.*

BY J. LANE.

AMONGST the evidences of the present century pointing to the development of art in its true beauty, nothing is more decided than the revival of the pointed style as exemplified by the multitude of new churches erected and the conscientious restoration of the cathedrals and churches in every part of the British Isles. With the castellated structure of similar periods there is a contrast, for, with the exception of here and there a stately castle (such as we have at Raby, for instance), age, storm, fire, tempest, and the exigencies of Civil War have removed the contemporary specimens; but, thanks to that feeling of veneration which a Christian nation has ever entertained for the temples of its religion, and not the less to the solidity of construction, so favourable

A CHARACTERISTIC OF ANCIENT BUILDINGS on solid foundations, the stately cathedrals of England have defied the ravages of time, wars, revolutions, and so-called restorations; and these mementoes of the nation's early piety still call nineteenth century architects to witness that abbot, prior, and monk of the pre-reformation days could design and erect edifices of surpassing grandeur and beauty, to provide models and specimens for our Gilbert Scotts, Streets, Burgesses, and modern designers of a class of work which was brought to perfection many centuries ago by such masters as Lanfranc, Ernulph, Anselm, Gundulph, William of Seno, Thoresley, Wykeham, and other early Churchmen whose works exist, whilst their names have almost been lost to posterity. We can still see

Massive arches broad and round,
That rose alternate row by row,
On ponderous columns short and low.
E'en on these walls the heathen Dane
Had poured his impious rage in vain.
Not but that portion of the pile,
Rebuilt in a later style,
Showed where the spoiler's hand had been.
Not but the wasting sea-breeze keen
Had worn the pillared carvings quaint,
And mouldered in each niche its saint.

From those evidences which still exist much may be gleaned of the ideas of the picturesque and beautiful breathed in the spirit of those early days. Who can deny but that there is much originality to be admired in the unique octagon of Ely, the spire of Salisbury, the nave of Winchester, the west window of York, the five aisles of Chichester, the west front of Wells, Peterborough's painted ceiling, Lincoln's angel choir, Exeter's minstrels' gallery. Situation of the edifice is, perhaps, the most important item in claiming for the picturesque

exterior. Many of our cathedrals lose much of the variety produced by the grouping of their fine outlines, by being built in the midst of large towns, on the low level of a surrounding plain (such as that of York); but, where the proportions are so fine that the building towers above the surrounding dwellings, the county reaps the benefit of a noble landmark. The Bell Harry tower of Canterbury, which I saw one autumn day from the Whitstable Road, with its golden fane illumined by the morning sun; Ely's beautiful lantern, visible o'er many a mile of dreary Cambridgeshire fen; York Minster, from Garrowby Hill; such landscapes as these testify to the cathedral as the centre-piece of a picturesque scene on which the eye loves to linger with delight. Lincoln, towering on its sovereign hill, has a prominence rivalled by no other cathedral, and is a landmark for thirty miles round, whilst the great Norman towers of Durham, the final resting place of St. Cuthbert,

Whose grand cathedral, huge and vast,
Looks down into the Wear,

possess in themselves unrivalled sites for adding to the enchantment of the surrounding scenes. Old Sarum stood on the top of a hill, but the storms made sad havoc with the previous cathedral, so that when in 1220 Bishop Poore had to face the task of its restoration, he chose another site on lower ground, now the city of Salisbury, so that, although greater protection was secured, much of the fine effect which its tall spire would have had on the landscape was otherwise lost. As pretty a view as I have ever witnessed was Lichfield Cathedral one February morning, its three spires reflected in the Bishop's Pool, with the frost covering the trees in the foreground. The three great arches of the west front of Peterborough present another picture of a bold exterior, whilst the elegant central tower of Gloucester is a graceful treatment of the square tower in the Perpendicular Period, which shows to great advantage compared with the more solid and massive Norman towers of the earlier cathedrals. The Gothic style has this disadvantage, that its interiors lack the colour decorations which add so much to the picturesque

INTERIORS OF THE CLASSIC STYLES.

This is not an unmixed evil, for the beauty of the carving is brought to the front, and the vaulted roofs and clustered columns afford outlines wanting in the St. Paul class of interior. Although in earlier days it was evident that mural paintings extensively adorned the walls of our earlier Gothic cathedrals, the examples which the occasional removal of whitewash affords us are apparently nothing better than frescoes in simple tints, and out of comparison with the mass of gilt colour usually to be found in the interiors of the classic design, colour being mainly left

to the stained glass window, of which we have so fair a specimen at York. The chief items of beauty I claim for the Gothic cathedrals are the fine vistas of clustered column. I often think it a pity, when showing visitors over cathedrals, that attention is not more often called to the magnificent perspectives which are afforded of clustered column and groined arch from various positions. Chichester with its five aisles is a splendid specimen of this grouping, and it at the same time affords a good example of the bold contrast of the pillars and pillars of black Purbeck marble backed up by the white Portland stone of the fabric, which is so picturesque a feature of the southern cathedrals whose builders had access to the quarries of the Isle of Purbeck.

On pillars lofty and light and small,
The keystone that locks each ribbed aisle,
Is a fleur-de-lis or a quatrefoil.
The corbels are carved grotesque and grim,
The pillars with clustered shafts so trim,
With base and capital flourish around,
And seem bundles of roses which garlands have bound.

THE foundation-stone of new Board schools at Douglas, Isle of Man, was laid a few days ago.

THE foundation-stone of the Jubilee extension of the General Hospital, Nottingham, will be laid to-morrow, July 7th.

THREE corner-stones of the new chancel about to be added to St. Bartholomew's Church, Marsden, Yorkshire, were laid recently.

THE foundation-stone of the new Church of St. Alban the Martyr, Westcliff, Southend, has been laid. The cost of the building will be about £2290.

THE foundation-stone of a new English church has just been laid at Dusseldorf. It will be a pretty Gothic structure, seating about 200 people.

AN appeal is being made for funds wherewith to reconstruct the present buildings of the Working Men's College, in Great Ormond Street. The estimated cost of the proposed work is about £15,000.

A new Salvation Army "citadel" is being erected on Battery Green, Lowestoft, by Mr. John Ashby. The new building is to include a senior hall and a junior hall, both on the ground floor; the building contract amounts to £1000.

THE handsome oak screen which has been erected in Windsor Parish Church as a memorial of the Queen's "Long and Happy Reign" was dedicated by the Bishop of Oxford a few days ago. Two shields on the screen bear the inscriptions, "V.R., 1837, and V.R.I., 1897." A dedicatory tablet will also be affixed. The screen was designed by Sir Arthur Blomfield, A.R.A., and has cost about £350.

*A paper read before the Northern Architectural Society.

THE VENUS OF MILO.

A RESTORATION RIDDLE.

M. REINACH made a most interesting communication respecting the statue known as the Venus of Milo, in the Louvre, at the annual meeting of the Hellenic Society held last week at 22 Albemarle Street. Professor Jebb, M.P., presided, and among those present were Sir John Evans, Mr. Penrose, Professor Percy Gardner, Mr. Ernest Gardner, the Provost of Oriel, and Mr. Blomfield Jackson. M. Reinach said he thought he had solved the riddle of the restoration of this Aphrodite. In 1892 M. Ravaisson published a photograph of a drawing of the statue as it was in 1819, the time of its discovery. On either side was a beardless Hermes with inscriptions. The first of these was the one that fixed the date at 260 B.C., but the other, which contained the name Theodoretas, was not as late as the middle of the fourth century. There was, therefore,

AN APHRODITE WITH TWO HERMES,

one having an inscription of 260 B.C., the other of 370 B.C., but there was no reason for dating the statue from one rather than the other, since neither of the inscriptions was on it. Now, in 1877 a number of statues were found together in Melos, which M. Tissot, then French Minister at Athens, tried, without success, to get for the Louvre. They included a colossal statue of Poseidon, some parts of female statues, and a statue bearing the name Theodoretas. The conclusion was that this remarkable statue of Poseidon of Melos belonged not to 50 B.C., but to 370 B.C. All those who had seen the two were struck by the resemblance that existed between this Poseidon and the Aphrodite of Melos in technique and in the folds of the draping, and some authorities had attributed them both to the same period. Having thus got to the opinion that the Aphrodite and the Poseidon were of the same period and technique, and had come from the

same workshop, he conceived the idea that they must be combined in some way, not as a group, but as a pair. Now, it had been suspected that there was something wrong in the designation of the Paris statue, and when the matter was considered, the name was seen to rest on little or no evidence. His theory, then, was that this Aphrodite was not an Aphrodite at all, but an Amphitrite. That would go very well with the idea that she was associated with Poseidon, and would help towards the proper restoration of the Paris statue. The great difficulty in restoring the Venus of Milo was that she seemed to be looking a long way away; and that her regards were directed upwards. For this reason restorers had not, so to say, known what to do with her eyes. But it had been observed that the statues of sea divinities often seemed to be looking as if they were examining the distant horizon, and this fact might be a clue in the case of the Venus of Milo.

THE STATUE OF POSEIDON.

had the right hand uplifted and holding the trident, while the left hand was approaching the body as if to take up the draperies. The Aphrodite might be taking up the draperies with the right hand and holding the trident in the left, and so the two might be imagined as responding to each other. The fragment of an arm holding an apple, exhibited with the Venus, he refused to take into account; it was not found at the same time as the statue, and its work was very poor. As a last consideration, he pointed out that Philochorus spoke of two big statues in Telos representing Poseidon and Amphitrite. At first, M. Reinach thought Telos might be a mistake for Melos, but further reflection convinced him this was not the case. The statement of Philochorus showed, however, that about 400 B.C. there were two statues of Poseidon and Amphitrite associated together in the adornment of a shrine, and it might be that about the same time a shrine of Poseidon in a neighbouring island—Melos—was adorned with two similar statues at the expense of a rich man named Theodoretas.

BUILDING BY-LAWS.

SOME AMENDMENTS AT LEEDS.

THE Leeds Corporation is seeking to amend and extend its powers in respect of building by-laws. The draft of the new by-laws has been under the consideration of the committee of the Leeds Incorporated Law Society, who have, through a sub-committee, carefully examined the scheme, and submitted to the Corporation authorities some important observations thereon. The first point which the committee have called attention to is that many of the by-laws are worded in a loose way, and that many words are used which have no definite legal meaning. It is contended that it is of the highest importance that the by-laws should be so expressed that there may be as little opening as possible for uncertainty as to the meaning of any particular by-law. Another point has been raised which is considered of equal, if not greater importance. According to the by-laws, if any issue arises between the Corporation and a property owner as to the question of whether the property owner has complied with the by-laws, the Corporation are to be

THE SOLE JUDGES.

There are two general questions of great importance, but there are many special points to which attention has been directed. It is contended that the powers given to the City Surveyor should be exercised either personally by himself or by some duly qualified deputy. Those who have had experience of the action of subordinate officials will, it is said, realise the importance of this point. There are by-laws having reference to public buildings which render it of the highest importance that it should be clearly defined what is a public building and what is not. To give an illustration of the uncertainty which would prevail if the by-laws were passed unaltered, it may be stated that a restaurant is a public building unless it be "merely a shop so used." Exception has also been taken by the Committee of

PENBURST CHURCH

the Law Society to the vagueness of the words "business premises" and "licensed premises." And, again, the words "domestic building" are used in a manner which leaves it uncertain as to what is a domestic building and what is not. Another most important matter is with regard to main streets. For a long time there have been many anomalies with regard to the

WIDTH OF STREETS IN LEEDS.

A minimum of 12yds. has been in operation with regard to newly laid-out streets, and it is the law that while two rows of cottages, if newly erected, must be separated from each other by a width of 12yds., the whole of the space must be flagged and paved as a street, although such street is not and can never be a thoroughfare. Many of the oldest thoroughfares in the town carrying an enormous amount of traffic are little more than half that width. The bottom of Woodhouse Lane is an illustration of this. Under the proposed by-laws streets will be divided into two classes, but it is pointed out that there is no proper definition of what is a main street; indeed, it is proposed to give the Corporation power at any time to declare any street to be a main street, and, when that has been done, certain provisions with regard to its width become applicable. In the laying out of new streets also it is proposed to require an absolutely straight line of frontage, which will, in many cases, mean—according to the view of the Law Society—an enormous waste of property, without any public advantage whatever. There is a by-law which may subject builders to very serious inconvenience. The builder is bound to submit his plans, and it is proposed to give the Corporation power, after the plans have been passed, to enable the surveyor to come in and stop the work by alleging that the plans are not in accordance with the by-laws. Power is proposed to be taken to prevent owners

ALTERING BUILDINGS WITHOUT SANCTION, but it is complained that there is no proper definition of what amount of alteration is necessary to confer this power. With regard to the gradients of proposed streets, the Corporation, it is alleged, seeks to be autocratic, for it takes power to require the easiest practicable gradient, which may throw upon the owner an absolutely prohibitive expense. There are some very important provisions with regard to the width of streets, and it is the legal view that in many cases it will be most injurious that there should not only be 14yds. space between two rows of houses, but that the whole of that space should be paved and flagged. If this power be given and enforced the result will, it is pointed out, be that the cost of building, and of course the rent, will be enormously and unnecessarily increased. Many other by-laws deserve careful consideration. As an illustration it may be stated that the 32nd by-law will prevent the erection of a carriage house, bicycle shed, or even a dog kennel within 15ft. from any building. Members of the legal profession commend these proposed by-laws to the careful consideration of all who are interested in the subject.

A HANDSOME pile of buildings, just completed, as the new offices for the Liverpool School Board, were opened last week.

THE West Ham Corporation has instructed Mr. A. Saxon Snell, F.R.I.B.A., to prepare plans for the erection of public swimming and private baths, and other buildings in Romford Road, Stratford, E.

A new parsonage is being built for the vicar of Radcliffe, and will cost over £2000. The erection of new day schools, which will require an expenditure of upwards of £4000, and repairs to the parish church are also being contemplated.

MEMORIAL stones in connection with the proposed new Baptist Chapel at Corris, Ireland, have just been laid. The building, which is being erected to the plans of Mr. J. Lewis Evans, architect, Aberystwith, will be of Gothic design, and is estimated to cost £400, with accommodation for about a hundred persons. The contract was let to Messrs. J. Humphreys and H. Davies, Machynlleth.

BOW, CHELSEA, AND DERBY PORCELAIN.*

BY WILLIAM BEMROSE.

A book upon such a subject as English Porcelain as manufactured in the five potteries of Chelsea, Bow, Longton Hall, Worcester and Derby, appeals to but a very small public. Amateurs of china will be interested, and to them such a work as this of Mr. Bemrose's should be extremely valuable; to manufacturers and to those who are interested in the history of Derbyshire and its manufactures also. The result of the researches of Mr. Nightingale (who is quoted by Mr. Bemrose) and of the author amongst advertisements in old newspapers, and hitherto in edited documents and deeds relating to these factories, appears to be to establish it as a fact that William Duesbury, who has hitherto had the credit of commencing the manufacture of such things at Derby in 1750, was anticipated by a man named Andrew Planché. The earliest advertisement in a London paper which refers to the sale of "Derby Porcelain" by auction (the usual mode of disposing of quantities of such things at that time to all appearance) appears in December, 1756, and it is impossible that these articles could have proceeded from Duesbury's factory, for he was working in London in 1751-53, facsimiles of pages of his work-book being given showing that at that time he was enamelling at small prices, pieces of porcelain made at Chelsea, Bow, Derby, and Staffordshire, and sold to the dealers in the white glazed state; and he appears to have been at Longton Hall in 1754 and 1755, where his father lived, while it was not till 1756 that he commenced the factory at Derby by turning seven houses into workshops, details about which are given by Mr. Bemrose, who also goes pretty fully into the question of the origin of these earlier examples of Derby porcelain. He comes to the conclusion that they must have come either from the Cockpit Hill pot works, or from the kilns of the aforesaid Planché, who made and fired small figures of animals about 1745, and subsequently made an agreement with Duesbury and Heath when the Derby factory was started in 1756.

A large part of the book is taken up with the textual reprints of old deeds, leases of various properties, agreements with workmen, catalogues, and lists of moulds and models belonging to Duesbury in 1795, the latter having been made by four old workmen in 1819 for the purposes of a Chancery suit. These last should prove very useful to collectors, as assisting in identifying specimens made before 1795. There is at the end of the book a chronology of the Chelsea, Bow, and Derby pot works, and of Duesbury's porcelain works at Derby, and diagrams of authenticated Bow, Chelsea, and Derby marks, which should also be of great use.

The notes about various workmen, the artists as we should say now, on whose labour the excellence of Duesbury's porcelain depended, are interesting, rescuing from oblivion the names of men of considerable talent in their special lines, as the excellent illustrations show:—J. J. Spengler, a Swiss, the best modeller employed at the factory (at a salary of £2 2s. a week!), Billingsley, Pegg, and Boreman, china-painters, and others. The artistic work is often misapplied as modern opinion would consider, but there can be no doubt that, apart from that misdirection, the work is very accomplished.

The book also contains all that is known about the Longton Hall porcelain works, together with many odds and ends of information relating to the making and selling of china in Derby, but it is not a book for the general reader.

S. S. G.

"Bow, Chelsea and Derby Porcelain." Being further information relating to those factories, obtained from original documents, not hitherto published. By William Bemrose. Bemrose and Sons, 23, Old Bailey; and Derby, 1898.

FOUR memorial stones of a new Wesleyan chapel at Monton, near Eccles, have been laid.

THE PRIORY OF INCHMAHOME.

BY C. E. WHITELAW.

THE island of Inchmahome is known as the "Isle of Rest" (although that is not the translation of the Celtic name "Inchmahome," as we shall see later on), and never was a title better bestowed; for here, during the Middle Ages, a little colony of monks lived a life of peace and plenty, out of reach of the ever flowing and ebbing tide of war, raving, and family feud that surged along the shores of the lake. For are we not on the line of demarcation between the Highlands and Lowland—the debatable land across which the marauding Highlander loved to stretch his claymore.

Taking a glance at the history of the Inchmahome Priory (Perthshire, N.B.), we find that Walter Comyn, fourth Earl of Menteith, in 1238 obtained the authority of Pope Gregory IX. to build a priory in the diocese of Dunblane, and on the Island of Inchmahome, for the religious men already settled there.

The Priory is dedicated to Mocholmoch, whose day on the calendar was June 6th, identifying him with Colman of Dromore, in Ireland, a Celtic saint of the sixth century who was called Mocholmoch. Skene, in a note in his "Celtic Scotland," says: "In Ireland it was the custom to prefix 'mo,' my, and add 'oc,' little, as terms of endearment, to the names of saints; when the name ended with 'an,' 'ok' was substituted for it. Thus we have the island mentioned in a document dated 1358 as 'Inchmah-cholmok,' 'the isle of my little Colman;' or Latinised as in another of about the same period, 'Insula Sancti Colmoci,' 'Isle of St. Colman.'"

The monks were of the Augustinian order. The church, as its Architecture shows, belongs to the First Pointed Period, and must have been commenced very shortly after its foundation in 1238, as the founder also endowed it. The plan shows an aisleless choir, 66ft. by 23ft. 8in. All the windows are of the lancet form, the eastern being of five lights.

There is a good sedilia and two ambries in the south wall, also the remains of what appears to have been a sacristy, with a lean-to roof against the north wall; from the base, &c., being carried round, it is evidently an original part of the design. (Comp. Dunblane.)

Here we have the graves of some of the most distinguished men of the families of Comyn, Stewart, Drummond, and Graham, with interesting monuments, unfortunately much defaced; amongst others that of Walter Stewart, Fifth Earl of Menteith, and his Countess. He was one of the most distinguished men of his day, fought at the battle of Largs in 1263, was a witness of the marriage of the Princess Margaret to Eric of Norway in 1281, and a distinguished crusader under Louis IX.

The nave has a north aisle, but no south aisle, and measures 75ft., and from 23ft. 8in. at east end to 27ft. 2in. at west end. This seems to be from the wall having been rebuilt. (Comp. irregularity in other walls.)

The details of the main arcade and the fine west portal are first pointed work of the best quality, and with the general arrangement of the plan, bear many points of resemblance to Dunblane Cathedral, which was being built at the same time (1233-1258).

There are remains of a tower at the north-west angle of the nave, but of later date, although there was evidently the intention to have one here from the first.

On the south side of the choir is the chapter house, an oblong, 24ft. by 15ft. (internally), with semi-circular vaulted roof and a chamber over, approached by an outside stair.

The cloister and cloister garth were on the south of the nave, but the buildings surrounding it have to a great extent disappeared, leaving the kitchen offices on the south-east side the best preserved portion, still retaining windows, fireplace, and drain. The kitchen is covered with a plain tunnel vault, and there was a story over.

The refectory probably ran along the south side of the cloister, and from the dormitory

over it ran a stair giving access to the kitchen for use during the day.

The Priory of Inchmahome, like the other ecclesiastical foundations in Scotland, was secularised at the Reformation, and in this case absorbed into the barony of Cardross. We have, therefore, as is unfortunately the rule with the people in Scotland, to deplore the destruction of the conventual buildings, and although one would not suspect it in this out-of-the-way place, the cause was the same old enemy—the realization of a convenient quarry for dressed stones.

We have only to look at the neighbouring island of Talla with its seventeenth century castle to see where the greater part went (see kitchen window), also at the curious avenue-like walled enclosure. The chapter-house seems to have been appropriated as a mausoleum by the Earls of Menteith and Airth, and this enclosure is said to have been built in haste to receive the remains of the first Earl of Menteith and Airth, who was assassinated in the camp of Montrose at Collace in 1644 by Stewart of Ardvorlich.

I cannot conclude without mentioning two illustrious sojourners—King Robert the Bruce, who visited Inchmahome on several occasions both as a wanderer and as a King, and Queen Mary, who, when a child of five was brought here by her mother soon after the battle of Pinkie in 1547, and resided here from September till the following February, when she left for Dumbarton en route for France.

The Duchess of Devonshire will lay the foundation-stone of the William Terriss Memorial Lifeboat House, at Eastbourne, on the afternoon of Saturday, July 16th.

COLDBATH PRISON, which is now being pulled down, was the scene of a serious accident, by which several men were severely injured. They were working on the top floor breaking down the structure, when the concrete flooring gave way, carrying the lower floors with it. Two of the men fell a distance of over 50ft.

THE ARCHITECTURE OF NEWCASTLE.*

A RETROSPECT.

BY FRANK W. RICH.

IT may be interesting to glance hurriedly with an architectural eye over the past famous sixty years, and see how Newcastle-upon-Tyne comes through the ordeal. In the year of Her Majesty's accession, Newcastle would wear an entirely different aspect to Newcastle of the present day. The boundaries of the town at that time might roughly be taken to extend on the west to the west end of Thornton Street; on the north, to Leazes Terrace; on the east, to Ellison Place; and on the south, to the Tyne. The growth of the city is not due to Architecture, but to the great commercial spirit that is now upon us. Newcastle, a little previous to the time we start (1837), was but a moderate sort of place, sleepy in a way, something like the keels that used to glide down the Tyne at high tide with their heaped-up cargoes of coals as compared with the present craft. There was the Castle, the older churches—All Saints and St. Thomas, the Assembly Rooms. And a quaint old place it must have been, and crammed full of history. But at this anterior period to the great epoch under review there was born a man who was destined to work a

TRANSFORMATION OF THE OLD PLACE.

one of those men of indomitable will, one of those great captains of industry for which Newcastle is so justly celebrated—I allude to Richard Grainger, sometimes called "the architect of modern Newcastle," a position to which I don't think he ever aspired, but who had the good sense to call to his aid the architects of his native town, and to imbue

* The inaugural address of the Session 1897-8, delivered by the President of the Northern Architectural Association, and just issued in printed form.

them with the enthusiasm of which he possessed so large a store. He must have been a bold man, and a shrewd one. His plans were most ambitious and gigantic, and his architects responded to the call, as, indeed, all men of art have done at all times, when not beset with hampering circumstances. Grainger was well on with some of his schemes at the time of Her Majesty's accession, and the making of the great railways may be said to be synchronise with this. After these preliminary remarks, we may now look at some of the Architecture of modern Newcastle, of that coming within the famous sixty years, and see what account our friends living or dead can give of themselves. As a means of better realising what I am about to say, we may imagine ourselves arriving by train at our Central Station. Here, we are at once confronted by a famous building, the work of our first president, a building designed in the very beginning of the railway system, when no one could foretell its gigantic growth, yet to-day this building is as useful as the day it was built, when other stations in Britain have become obsolete, and swept away to

GIVE PLACE TO MODERN STRUCTURES.

Coming out into Neville Street we obtain a fine view of the station, a building, from the clock tower to the west end, full of dignity. It is a matter of regret to us all that the original majestic design for the portico (which now hangs in the vestibule of the Museum of Natural History) was not carried out instead of the existing portico, and an equal matter of regret that the eastern extension of the station should not have been carried out on the lines of the original design, instead of the sort of coal depot roof lately erected. For these matters the directors must be blamed, and ought to be heartily ashamed of themselves. I make these remarks because I believe it echoes the view of all architects, and also in defence of the able man who designed the original building. The view from this spot as a "townscape" is somewhat unique. In looking to the east, we bring in the view Collingwood Street and Mosley Street, up to the Arcade, and in which the famous tower and spire of the cathedral group well. Looking in a more northerly direction, a similar view is obtained of Grainger Street, with the domes of the Exchange, and equally admirable monument to Earl Gray, closing the vista. We may now walk down Neville Street, and in doing so one cannot forget the change that has been effected in so short a time. One can remember Neville Street so well before Grainger Street was cut through, when all the buildings round about were

OLD TIME BUILDINGS,

and now nearly every one of them are new. The street, as we all know, is a very spacious one, broadening out very considerably at the Monument to George Stephenson, and with the modern buildings, now erected here, forms as fine an entrance to a city as will be difficult to beat. The entrance into London from King's Cross is shabby compared to it, as is the case in many of our principal cities. The buildings from the Douglas Hotel to the offices of the Standard Insurance Company are all modern business premises, save one, and on the other side of the street is the very large hotel lately erected by the North-Eastern Railway Company. The Union Club faces us as we proceed, forming a fine group with the offices of the Newcastle Chronicle, Messrs. Emleys, and the offices of the Union Insurance Company. The mention of the offices of the Chronicle remind me of my younger office days about thirty years ago, when this building was designed by my old master—Mr. Parnell, a member of our Association. Before that time it was the town house of Dixon Dixon, of Unthank. To the south, where once stood the picturesque old Westmorland House, we have the offices of the Coal Trade, a very fine design by our ex-president. We now enter Collingwood Street, which, when I knew it first, was entirely residential. It is now something like the City of London, bereft of residents. The building that arrests our attention is the very fine Bank, lately erected by Messrs. Hodgkin and Co. It is a stately and thoroughly gentle-

INCHMAHOME PRIORY: WEST DOORWAY.

manly building, and reflects the greatest credit on a lamented colleague (Mr. Robert Johnson), and the liberal-minded directors who allowed him "rope." A very fine block opposite—the offices of the Northern Assurance Company—is by the same artist. I must not forget a small building to the east of the bank, which was designed by Mr. Parnell, and was the first break into the residential quality of this street, and for many years stood high above the rest of the buildings. We now come to St. Nicholas Square. On the one hand, we have the Town Hall buildings, stretching from the square up into the Bigg Market, occupying the site of some very quaint old houses, which I remember very well, and on the other, the street called the High Level Approach, a very extensive range, the High Level buildings (the work of Mr. Parnell), and opposite, a picturesque block of offices by a past president (Mr. John Johnstone). Coming into Mosley Street, and proceeding half way, we come to a famous corner, one that would be difficult to equal in any provincial city. At this particular spot, the meeting of Mosley Street, Dean Street, and Grey Street, there is food for contemplation, as each corner presents something worth seeing. At one, the National and Provincial Bank, by the late John Gibson; another, the new building of the Prudential Assurance Company, by Mr. Waterhouse; and at the corners of Grey Street we have the start of what we call the Grainger buildings. At the head of Mosley Street stands the Arcade, one of

GRAINGER'S AMBITIOUS PROJECTS,

and a stately termination to the street. Passing down Dean Street, and under the very fine arch which carries the North-Eastern Railway—a credit to engineers—one wonders why they did not carry the railway on one of the terrible utilitarian structures they delight in, floating like a spider's web, and proportionately ephemeral; but this is a good, honest arch. Passing under this, one sees on all sides new buildings by colleagues yet amongst us, and many by others gone to their long home. At the angle of the Sandhill stand the very fine offices of the Royal Insurance Company, designed by Parnell, and further on the huge commercial buildings of Lombard Street, Queen Street, King Street, the Sandhill, etc. While we are at the river-side, we might from the Quay look for a moment at the High Level Bridge, one of the most architectural engineering bridges in the country. Its design may be obsolete, but it far and away excels the terrible wrought-iron bridge a few hundred yards further west, which may be said to be entirely devoid of the faintest æsthetic design, and is an insult to our time. Coming back to the foot of Grey Street, we now undertake by far the greater portion of our task, for we now start with

THE NOBLE BUILDINGS OF GRAINGER

and his architects. We must content ourselves with a very cursory glance. Taken altogether, they form one of the most extraordinary instances of town building ever conceived and carried out by one man. Within a year or two, they all practically fall within our period. The buildings in Grey Street, Shakespeare Street, Market Street, Hood Street, Grainger Street, Nelson Street, Nun Street, and Clayton Street yield a quantity and quality that should satisfy the most exacting. As I said before, Grainger had the good sense to be guided by experienced architects; hence we have the buildings well designed, which means that detail and grouping are useful. There are, especially in Grey Street, buildings of the finest Renaissance design where students will find a wealth of material, and it must not be forgotten all these buildings are of a genuine stone, not stuccoed and painted, and when newly built, clean as they came from the hands of the mason, and seen in a brilliant sunshine, they would, indeed, resemble a veritable palace of Architecture—a re-building of Rome. To describe them all is out of the question, but we may just glance again at Grey Street, and the best view is to be obtained at the junction with Mosley Street. Here the full and graceful proportions of the whole is taken in, but not quite at one view—

a circumstance which adds to the charm, for Grey Street not only ascends with a gentle gradient, but bends proudly away to the right with a noble sweep, passing on the way, the Bank of England, the Theatre Royal, the group of the Exchange, with its finely designed domes, Lambtons' Bank, and terminating with the monumental column in memory of Earl Grey. They are familiar to us, but possibly, like the prophet in his own country, not sufficiently appreciated. So subtle is the design of this street that, while rising and curving, no harsh or abrupt treatment can be observed, each building though separately designed falls into one harmonious group. We may now leave this mass of modern buildings, and may safely say they stand a lasting monument to the genius of Richard Grainger and his architects, Dobson, Green, Wardle, and Walker. Grainger Street West has not yet been mentioned. It is a comparatively new street, built since Grainger's days, and entirely by individual owners, the buildings being designed in every case by local architects, the result being a great diversity of design from the tail end of the Gothic revival down to date. I might also mention the new offices of the Water Company and of the Gas Company. My list, I am afraid, is but half complete, but I think I have enumerated enough to show the

ENORMOUS MASS OF COMMERCIAL BUILDINGS

that have been erected here in this period, from the designs of our colleagues. I will now run over a few of the buildings that cannot be said to be commercial—the College of Medicine, by our friends Messrs. Dunn and Hanson; the College of Science, by the late R. J. Johnson, with whom I had the pleasure of being associated; the Museum of Natural History, St. Stephen's Church, St. Aidan's, St. Michael's, St. Matthew's, St. Peter's, St. Mary's (Rye Hill), St. Dominic's, St. James's, the Roman Catholic Cathedral by Pugin, with the tower and spire so ably added by our ex-president. This short list, taken at random, could be multiplied many times. I have not even said a word about the works and factories that abound with us, and in which Architecture is often called to aid, and possibly this address would be incomplete were I not to mention that enormous hive of industry—the Elswick Works, where I have had the honour and privilege of carrying out some of the finest shops in the world. I have been in many of the chief cities of England and Scotland, from time to time, and looked about me, and often with a view of finding anything better in this respect than we have in Newcastle, but have been unable to find any. Newcastle will hold its own either in Architecture, or in its administration of cleanliness. In speaking of the continued commercial prosperity, one often notices how in a busy practice commercial men often

MOULD THE WAYS OF ARCHITECTURE.

The imperative demands of trade are often antagonistic to the precedents in Architecture. For instance—take a familiar case—the shop windows of our city, or any city, show the busy man will insist on having his window in one square of glass, or, because he cannot get any glass large enough, he will divide them by gossamer bars. I am quite sure his goods would be as well seen if shrined in architectural encasements. It would seem also, in walking through our streets, that the Architecture will presently be "behind the scenes"—in other words, it will be covered by huge letters of the alphabet. What is the cause of this trumpeting from the house fronts? Have we all become short-sighted, that we cannot see to read a man's name in moderate letters? I once lost a good client for declining (politely, I hope) to carry out some letters of this nature, over 9ft. high. It has often been said that an architect without the men of the building trades would be like a commander-in-chief without soldiers. The men of the building trade are our soldiers, and the excellence of their workmanship is of vital importance to us; and we cannot help but notice the nearly total extinction of some trades.

A DECAYED IPSWICH CHURCH.

A PLEA FOR RESTORATION.

AN appeal is being made for funds to restore an old and decrepid church at Ipswich—"one of the finest and most interesting churches in the county town of Suffolk"—to quote the architect's description. The edifice is that of St. Mary Key. It is an excellent example of fifteenth century work. The nave—to continue the description of Mr. E. F. Bisshopp, the Diocesan Surveyor—is spanned by a massive and splendid double hammer beam roof, the timbers of which are richly moulded, and the hammer beams, cornice, &c., were originally ornamented with angels and the strawberry leaf ornament. The faces of the wall pieces are carved as figures, and the whole is a specimen of mediæval workmanship of the greatest possible interest, and as a work of a past age of priceless value to the town. The former roof to the chancel was no doubt in harmony with that of the nave, but it has been unfortunately destroyed and replaced by a heavy erection fixed so low as to completely

SPOIL THE PROPORTIONS

of the church. There is a fine clerestory, richly panelled in freestone and flint on the exterior. The tower, which is 19ft. square and 73ft. high, has a very striking appearance, and once commanded the attention of visitors from the River Orwell, but it is now overshadowed by lofty mills, which completely hide this noble structure from this point of view. The roof is constructed of chestnut, and is in a most serious and dangerous condition. The ends of the lower hammer beams have rotted away, and have but little bearing upon the walls, and the feet of the principals, which rest on the hammer beams, are in a like condition. Of the wall plates but little remains, and the top of the walls is a mere mass of decayed wood and rubbish. The timbers generally are rent and split, and the pins in the tenons are snapped. Parts of the roof are in danger of falling at any time. To properly repair the roof it is absolutely necessary that it should come off and be re-framed and spliced. The clerestory on the north side is in a terrible state; the exterior face of the masonry to the windows and panelling to the walls has entirely perished, and the tracery has been made good with mortar, cement, &c., so as to hold in the glass. The parapet is also in a loose condition. The sanitary state of the church is distinctly bad. Owing to the low level of the floor, it has been flooded by high tides and storms on numerous occasions; dry rot has been set up, and a deposit of sewage and other matter has accumulated below the floors, and a sickly and disagreeable odour pervades the building. To remedy this state of things it is proposed

TO RAISE THE FLOOR

14in., covering the whole with concrete, and to pave the aisles. This can be done without spoiling the proportions of the sacred edifice. The south porch has been much mutilated; the side windows have been blocked, parts of the roof removed, unsightly exterior doors have been erected. It is proposed to restore this structure, and to use it as the entrance to the church. The east window of the organ chamber is in a dilapidated state, whilst the south window has been blocked up and cemented over in an unsightly manner; stone has been replaced by white brick, buttresses patched up in brick and cement, parapets badly rebuilt, and other work of the kind, whereby this side of the beautiful church has been greatly marred. Finally, it is proposed to clear away the bad patchwork of modern times, and to replace it with work of the original design, and thus to bring back this ancient church as far as possible to its ancient beauty and stability.

FOUNDATION-STONES have been laid of a Wesleyan school-chapel at Wood Street, Holly-wood Park, Stockport, to take the place of a mission at Queen Street West. There will be accommodation for 280 children, at a cost of £1900, inclusive of the land.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

July 6th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE artistic poster is threatened with a serious danger in the shape of the new decorative hoarding, from which advertisements are excluded. Several hoardings of this kind have been seen lately in Regent Street and other thoroughfares, but a much larger and finer example has just been erected in Oxford Street. This hoarding, which surrounds the site of some new buildings, is of immense size, and is ornamented with a bold and striking design in white, yellow, and sage-green. A border of stencilled garlands, alternated with classic masks, runs round the hoarding, and adds considerably to its effect.

SOME excavations at Hampton Court Palace have brought to light the forgotten water-gate and gallery, built by Henry VIII., through which the State barges passed from the Thames into the palace. The walls or piers are of immense thickness, being no less than 25ft. wide, and on these massive foundations—which were built in the river—formerly stood a large picturesque building of several stories, which was known as the water-gate. In this place Princess Elizabeth was kept as a prisoner of State by her sister, Queen Mary, and there subsequently resided the consort of William of Orange while the new State apartments were being erected. After the death of his Queen, William III. had the building demolished, as it obstructed the view of the river from his windows.

A MOVEMENT is on foot for establishing a central museum for the reception of London antiquities. Such an institution, however, is already in existence at Guildhall, and it is questionable whether there is need of another building. The Guildhall museum is rich in relics of old London; and, that being so, has a right to claim prior attention when a permanent home is desired for their antiquities by those who take an interest in the past history of our great Metropolis.

AN ancient Roman hospital has been brought to light at Baden, near Zurich, the discovery having been made in connection with recent excavations at Windisch, the Roman Vin-donissa. At Vindonissa the two great Roman roads met, the one leading from the Great St. Bernard along Lake Lemano and then by Aventicum and Vindonissa to the Roman stations on the Rhine; the other leading from Italy to Lake Constance by the Rhaetian Alps, the canton which is now Winterthur, Baden, and Windisch. The last point was the station of the seventh and eighth legions, and close by the Roman road the hospital has been discovered. It contains fourteen rooms supplied with many kinds of medical, pharmaceutical,

and surgical apparatus, the latter including probes, tubes, pincers, cauterising instruments, and even a collection of safety pins used in bandaging wounds. There are also medicine spoons in bone, and silver measuring vessels, jars, and pots for ointment, some still containing traces of the ointment used. The excavations have also revealed a large number of silver and copper coins, the former belonging to the reigns of Vespasian and Hadrian, and the latter bearing the effigies of Claudius, Nero, and Domitian.

THE Camberwell School of Arts and Crafts—founded as a fitting memorial of Lord Leighton—has just been re-opened, and an interesting collection of works by Early English masters hung on the walls of the well-lit and spacious gallery formed the chief attraction of the function. These were lent by Mr. J. W. Bacon, and include examples of those painters who made English landscape famous in the middle of the seventeenth century, and were the real inspirers of the romantic movement in France. Constable is, of course, the most noted, but the series, admirably arranged and hung by Mr. Cecil Burnes, who is the curator of the schools, appropriately starts with a beautiful composition by Richard Wilson. The great English master is seen here as a sort of connecting link between the artificiality of Claude and the search after truth which lay at the base of all Turner's most poetic and finely fancied visions. The quiet classic feeling in this Italian landscape, its composition formal, but in no way conventional, and its exquisite colour mellowed by time, make it one of the gems of the collection. Turner himself is seen in an early work, Crichton Castle, the castle itself set four-square on its plateau of hill, amidst the surrounding hills, a solemn and impressive landscape, with its dignified composition and fine opposition of light and shade. This is a finished work of the painter's early period. Muller's love of decided colour and sudden contrast, his almost dramatic effectiveness, his admirable lightness of hand, are all seen in the wonderful little sketch, "The Good Samaritan."

THERE are some delightful examples of David Cox. How delicate is his colour, how nervous his method of expression. Take the little canvas "Morning;" it is so brilliant, so full of light, the colour so pure, the reference to Nature so direct. Near it is a Bonington, a tossing sea under a stormy sky, an effect the young artist has painted again and again. The collection is very rich in Constables, and in Constable at his most interesting stage—the study and the sketch. We must remember this gallery is attached to an Art school to realise the peculiar value of the collection which Mr. Baker has lent for exhibition. Here is a small version of the "Cornfield," which, with its added flock of sheep and drinking boy, is so well known in the National Gallery, and, more interesting still, here is the sketch for the famous Salisbury Cathedral, now at South Kensington. There is a freshness and fancy about a sketch, a sense of inspiration which often eludes the painter when he sets himself to elaborate in first idea. We can see this in these little canvasses of Constable, as in his "Dedham," we can see how the painter can suggest space and distance, and show us the sketch of landscape wrapped in air. A little De Wint—another sketch, small in scale, but large in effect—shows us the great master in water-colour working in the stronger vehicle.

COMING to the figure painters, there is interest again in the variety of the show. Here is an Ety, a traitor flung from the Tarpeian Rock, and seen falling head foremost down the precipice, painted with the glowing colours of a Venetian master, and with a modelling of flesh which the Venetians never attempted. Two other Ettys—nude studies—have his luminous colour, and escape his occasional vulgarity. Most interesting is an early Leighton, "Cimabue and Giotto," very accomplished in its grouping and very German in colour. Millais is represented by his portrait of that sturdy sportsman, Sir John Astley;

and by the pathetic "Stitch, Stitch, Stitch," in its grey scheme of colour, with its silvery quality, the very hands seem to move, and by a child's head, as pure and vivid in colour as a Van Eyck. There is a portrait of Tennyson, by Mr. Herkomer, wrapped in his black cloak, looking very severe, with lack lustre eyes and peaky brow, the look of power, which Millais found in his sitter, quite absent. Mr. Herkomer is more successful, is absolutely successful, in his likeness of Mr. Ruskin, where he gives all the refinement of that delicately-featured face, modelling nose and mouth with infinite care, and choosing a colour scheme, cool greys and blues, most fitting and most feelingly rendered. Here our notice must end, but visitors will pause before the beautiful Rossettis, before Henry Moore's flowing seascape, Tintoretto's glowing portrait, and a fine series of Dutch masters.

THE work of Mr. Mortimer Menpes is full of pleasant surprises. He always likes to go out of the beaten track, and he ever has some novelty in the way of subject, technique, or even framing. In these days when everybody copies everybody else, and when even a good idea or an original notion becomes tiresome from the fact of its being everlastingly imitated and very much spoilt in the imitation, it is refreshing to find an artist who is continually taking a new departure. Mr. Menpes' latest achievement is the production of etchings in colour, and a very remarkable series of these works is now on view at the Dowdeswell Galleries in New Bond Street. There are but five-and-twenty etchings on view, but every one of them is worth the most careful study, as a fine example of the artist's success in an altogether new Art. In these days, when the coloured prints of the beginning of this century are being so much sought after, and are realising such extravagant prices in the sale room, colour-etching should undoubtedly receive its due share of patronage.

THE colour-etching would seem to have considerable advantage over the old-fashioned print by reason of its superior richness in tone and brilliancy of colour. Many of the works on exhibition have all the power and mellowness of an Old Master. Especially may be mentioned "Achilles," after Rembrandt; "Mrs. Currie," from the picture by Romney, the wondrous rendering of Piero della Francesca's "La Contessa Palma," and the marvellous study of the head of a wrinkled old dame entitled "Marie Jeanne of Finistère." On the other hand the rendering of the delicacy of landscape and the refinement of atmospheric effect would appear to be equally within the power of the artist in his new method. This may be easily proved by the study of such examples as "The Harbour, Boulogne," "Santa Maria della Salute," and the subtle contrast of hot and cold colour in "Cashmere." No explanation is given as to the new method, but as the whole of the plates have been etched or dry-pointed by Mr. Menpes, and have been printed by him at his own press, one may conclude that the most satisfactory result is brought about by a close union of Art and craft, that the Art is craftslike and the craft artistic—that the skill of the artist is admirably recorded by the most accurate knowledge of the capabilities of his method, coupled with a masterly technique. Whether Mr. Menpes used one plate or many, or what may be the mystery of his treatment of plates or his method of printing, we care not. All we can say is that the result of his labour, as we see it on the walls of the gallery, is surprisingly beautiful and effective.

THE remnants of an old camp, which dates back at the least for eighteen centuries, may yet for a short time be seen, writes a correspondent, within a few miles of the City of London. These earthworks are at Uphall, in Essex, on the east bank of the river Roding, about midway between Ilford and Barking. Until the present year the whole area, over forty-eight acres, had been in farming occupation for many centuries, but now the grip of the speculative builder is laid upon the site. Already the larger portion of the estate has

been sold. To all who value such relics of the past it will be a matter of regret to know that the levelling of these earthworks will soon be effected, and that all traces of the ancient camp will entirely disappear. A few months ago some attempts towards its preservation as an open space or as a public garden were made, but the enormously increased value of the land precluded any lingering chance of rescue from destruction. Notices of this camp, meagre enough, are given by various Essex historians and other writers from Camden downwards; but the most important is that quoted from a MS. history of Barking, compiled about the year 1750 by Smart Lethieullier, a famous antiquary, who resided at the manor of Aldersbrook, in Little Ilford.

MR. LETHIEULLIER thought that the intrenchment was too large for a camp; in his opinion it was the site of a Roman town, although no traces of buildings had been found on the spot. This he accounted for on the supposition that the materials were used for building Barking Abbey, and for repairing it after it was burnt by the Danes. In support of this opinion, he related that, upon viewing the ruins of the Abbey Church in 1750, he found the foundations of one of the great pillars composed in part of Roman bricks, and that a coin of Magnentius was found also among the ruins. From its general form and position, and by comparison with other early earthworks, we may, however, well conjecture that this camp was of prehistoric origin, and in all probability a British settlement subsequently occupied by the Romans, who commonly adopted such well-chosen sites for their own camps. An opinion has also been expressed that it owes its origin to the Norman Conqueror, who made the adjacent Abbey of Barking his residence until the Saxons had quieted down and the Tower of London had been built or rebuilt; but that is most improbable, although he may have pitched the camp of his army upon this ground during that period of unrest. Apart from these early remains, a further interest attaches to the farm at Uphall. While excavations for brick-earth were being carried on some thirty years ago the fossil bones of many animals of prehistoric age were exhumed, amongst them those of rhinoceros, hippopotamus, lion, bear, and, notable above all, the huge hairy mammoth, with the only complete skull and tusks which have ever been discovered in Great Britain. This was carefully preserved under the direction of Sir Antonio Brady, and may now be seen in the Natural History Museum at South Kensington.

THE doors of the "Old White Horse" in Fetter Lane have at last been finally closed, and one of the very few old coaching inns left in London will soon have disappeared beneath the pick and shovel. At the dawn of the railway era no fewer than sixteen mail coaches left and arrived at the "White Horse" daily, without mentioning stage wagons and post carriages. The long row of stables, surmounted by rambling corridors of bedrooms, reach right back to Fumival Street on the west. The old inn is also intimately associated with the modern Rowton Houses which are springing up all over London, for Lord Rowton's maternal uncle, the late Earl of Shaftesbury, once conducted the house as a model dwelling for working men. The site occupied by the house and stable-yard is a very large and valuable one, the whole being undermined by vaults of even greater antiquity than the most ancient portions of the old buildings.

"It has for many years been felt in Switzerland," writes a correspondent to the Times, "that it was unworthy of the country to allow the national antiquities and relics of its past history to drift away into foreign museums and collections, and the idea of a national museum has been gradually taking shape. Little knowledge of human nature was necessary to see at the outset that the citizens of Basle, Berne, Lucerne, and Zurich would each think that the national museum would most fittingly be placed under their charge. A solution of the dilemma was at first sought in

the arbitrament of independent experts—the late Sir Wollaston Franks of the British Museum, M. Dareel of the Musée Cluny, and Dr. Essenwein of the Nuremberg Museum. These men decided in 1890 in favour of Berne, but this verdict, though temporarily accepted, was afterwards overruled in favour of Zurich, where the Swiss Chambers finally decided that the Landes Museum should be placed. Those who are fortunate enough to see the result will have every reason to approve their judgment. The citizens have not spared their money in providing a fitting home for the national relics, nor has the Government, on its side, been at all niggardly in providing funds for buying back such of these as had drifted into foreign collections, while many Swiss corporations or individuals have with great liberality given or deposited their possessions in the museum.

"FROM the fifteenth century onwards the arrangement of the museum is strictly chronological. It contains, for instance, a series of rooms of the various periods, each furnished with appropriate contemporary objects. Many series of objects, however, are not capable of being subjected to the chronological arrangement, and in other rooms are collections of antiquities from the earliest times of the Stone Age in Switzerland up to the Costumes of the Cantons in the present century. These rooms are to some extent of the same character as those with which one is familiar in other museums, but it will generally be found that the doorway, the panelling of the walls, or the ceiling, is in itself worthy of examination. The room in which the majolica plates made at Winterthur are exhibited is an example of this, since the background for the dishes is formed of the sides of an old panelled room from Berne. The combination of the ordinary museum methods of arrangement with the reproduction of historical interiors lends a charm and variety to the collection which greatly lessen fatigue. To pass from the sombre tints of the low wood-panelled rooms of the seventeenth and earlier centuries to the 'Rococo zimmer,' with its bright decoration and cases full of porcelain, gives a sense of relief to the eye, and the visitor is refreshed rather than wearied by each new thing that he sees. The town architect, M. Gull, has planned a building which, while perfectly satisfactory in its internal arrangement, as was seen on the occasion of the opening ceremony some ten days ago, is at the same time a handsome addition to the architectural ornaments of modern Zurich."

AN exhibition of students' work in the various crafts embraced by the Central School of Arts and Crafts (established by the Technical Education Board of the London County Council at 316, Regent Street) is being held this week. Specimens will be shown of bookbinding, silversmiths', goldsmiths', and jewellers' work, chasing and engraving, enamelling, stained glass, leadwork, stonework, woodcuts in colour (by a method based on Japanese practice), also modelling and designs for various processes. The School, which is just completing its second year, has been very successful in the object for which it was established, viz.:—To provide for apprentices, journeymen, and others engaged in the more artistic trades, such individual training in design and manipulation as each student may require in relation to his own particular craft. Admission to the School is, within certain limits, only extended to those actually engaged in these trades, and it is outside its scope to provide for the amateur student of drawing and painting. It is gratifying to note that the resources of the building have often been severely taxed during the past session, over 500 students having been registered; many of those have derived the greatest benefit from the opportunities afforded for supplementing their daily practice in the workshop, where, owing to the subdivision of processes of production, they have little opportunity of gaining a broad view of their craft as a whole. New classes are contemplated for next session, commencing September 19th, in writing and illumination, wood-carving and

gilding, and tapestry and other weaving. Full information as to these or other classes can be had from the Curator at the School.

THE stairs at the Royal Courts of Justice are inflicting an intolerable strain on the physical powers of those who have frequently to use them. The managing clerks of solicitors, being conspicuous sufferers, have drawn up a pathetic petition to the House of Commons, and entrusted it to the sympathetic hands of Sir Edward Clarke. It is the journey to the offices on the upper floors that tries the clerks. From the offices on the ground floors to those of the Masters and Registrars up aloft the steps have been counted. They vary in number according to the point of entrance, but, on an average, they may be reckoned at 110. To go up and down 110 steps continually is really too much like turning the Royal Courts of Justice into a treadmill. The petitioners therefore pray for the erection of passenger lifts at various convenient places in the building.

A CORRESPONDENT writes to say that it is a mistake to suppose that Fleet Street and the Strand cannot be widened, although he admits that no insignificant increase of width will meet the growing evil of congested traffic. Both in Fleet Street and the Strand, by arrangement between the County Council and the local authority, important corner blocks have been set back on rebuilding within the last year. In the case of Fleet Street, the County Council and the City Corporation pay in equal moieties for the cost of the improvement. In the Strand, the District Board of Works carries out the work and effects the purchase, but the payment is made out of the county rates, or, rather, a loan incurred thereon, by the L.C.C. The intention is to continue the process of partial widening, as opportunity occurs, step by step; but it must necessarily be slow and inadequate. So far as it goes, however, it makes for comfort.

In the beautiful Collegiate Church of St. Saviour, Southwark, the Duke of Connaught has just unveiled a stained-glass window, which has been placed in the north transept, to the memory of the Prince Consort, and which forms a notable addition to the many interesting memorials that adorn the edifice. The window is the Jubilee gift of Mr. F. Lincoln Bevan, and the subjects represented in the four panels are Gregory the Great, Ethelbert, Stephen Langton, Cardinal Archbishop of Canterbury, and William Wykeham, Bishop of Winchester—architect, statesman, and father of the public-school system in this country. Especially appropriate is the inclusion among the figures of Bishop Wykeham, seeing that in the year 1362 he was ordained sub-deacon and priest in the chapel adjoining the west end of St. Saviour's Church. In addition to the Prince Consort memorial his Royal Highness unveiled two other windows, one to perpetuate Edward Alleyn, the actor, and presented by the governors and scholars of the college that bears his name, and the other in memory of Elizabeth Newcomen, a benefactress of the parish in the seventeenth century, this last being the gift of the scholars and governors of her scholastic foundation. The design of the three memorials is the work of Mr. C. A. Kempe, and is, in each case, appropriate and artistic.

MESSRS. CHRISTIE, MANSON, and WOODS sold on Saturday week the collection of modern pictures and water-colour drawings of Mr. H. Howard, of 4, Lancaster Gate, Regent's Park, the 128 lots realising a total of about £2000. The water-colour drawings included an example of Copley Fielding, a view near Lewes, Sussex—96 guineas; and the pastels, a pair of portraits of two ladies in fancy dress, of the period of Louis XIV.—£70. Pictures: Vicat Cole, Streatley Reach—70 guineas; C. M. Dubufe, "Pandora"—68 guineas; three by G. Romney, Lady Hamilton as "A Vestal Virgin"—135 guineas; the same as "Miranda," with lithography by J. W. Slater—98 guineas; and Jane, Duchess of Gordon, and her son—40 guineas; several by G. B. Willcock, the

best being Holly Street Mill, Chagford, Devon, and Nympt Hill, near Moreton—each 38 guineas; and Bathford Hill, near Bath—39 guineas; and J. van Stry, view near Dordrecht, cattle reposing—70 guineas.

MESSERS. CHRISTIE, MANSON, AND WOODS have just sold a small collection of interesting objects and old English furniture from Bilton Hall, Rugby, formerly the residence of Joseph Addison, and property from other sources. The Addison articles included an old English walnutwood arm-chair, arms carved with scroll foliage—21 guineas; an old English bench, boldly carved with scroll foliage—26 guineas; a panel of old English needlework, representing a stag hunt—£20; an old inlaid walnutwood cabinet, carved with Moses with the Tables of the Law, 89in. by 90in.—44 guineas; and a pair of Chippendale mahogany folding card tables—32 guineas. The other properties included a Louis XVI. oblong table of mahogany, richly mounted—76 guineas; a large cylindrical-shaped old Nankin vase, painted with dragons, scroll foliage, and flowers, in white on blue ground, 18in. high—155 guineas; a stomacher, of enamelled silver gilt and gold, richly mounted with coloured stones—95 guineas; a silver censer of Gothic design, with numerous figures of the Madonna and Infant Christ—£40; a tall cup and cover, formed of an ostrich egg, mounted with silver gilt—£42; and an oviform vase and cover of silver gilt, richly chased with the Triumph of Neptune and Amphitrite in two medallions, 23in. high—£75.

CANON GREENWELL and other antiquaries are engaged in superintending excavations near Driffield, Yorkshire, where are situated some 200 ancient burial mounds. Up to last year these were locally believed to be the burial places of Danish settlers, but the discovery of chariot wheels and horses' bits, as well as some enamelled ironwork, settled the question of the origin of the mounds, which were raised over the bodies of persons of the early iron age (about 100 years before Christ). A further number of the mounds have already been opened, with interesting results. In one mound, 20ft. in diameter and 2ft. high, a grave was found 5½ft. long, 4ft. wide, and 9in. deep, which contained a perfect skeleton, lying on its left side, with the head to the north-east, the arms being bent up, with the hands near the head, and the knees in the same direction. The bones were in very good condition, although broken. In this mound was also found an earthenware food vessel of dark-coloured ware, 6in. in height, the pottery being characteristic of the period. At the back of the head of the skeleton was a small bronze fibula, very well made, and in excellent preservation. In another grave the body had been laid on the right side, and the spinal column was curved, the head bent forward, indicating pressure from the earth above. The left arm was under the chin. No ornament or vessels were found therein.

A CONFERENCE of artists, clergy, and others interested in the work of beautifying churches by decorative Art was held last week, under the auspices of the Clergy and Artists' Association, at the Chapter House, St. Paul's Churchyard, "to consider the best means of promoting the reunion of religion and Art." The Dean of Rochester, who presided, said that there was no better example of a church having been vastly improved by Art in every sense than St. Paul's Cathedral. Gounod once told Dr. Stainer that the mid-day celebration at St. Paul's was the finest service that was held in any Church in Europe. Such praise from one who was of another communion was remarkable. So much for music. With regard to those branches of Art which charmed the eye one had only to gaze at the reredos and the beautiful mosaics. There was no church in Christendom which had done so much for the revival of Art and religion as St. Paul's. Art was expelled from the churches of England on account of its abuse in the shape of a combination of Art with idolatry, with winking pictures and pretended miracles. Art had been well called the handmaid of

religion, but the handmaid had been superseded by a kind of charwoman, of whom it might be said she wanted nothing but what she broke. Sixty years ago the state of our churches was disgraceful, but now there seemed to be a change for the better. With the great revival of spiritual religion in England there had come a desire for the re-union of religion and Art. It was a mistaken idea that things beautiful in churches were all Roman. The Pope had not got all things that were beautiful in Art.—The Rev. W. H. Draper, Sir William B. Richmond, R.A., and Canon Rowsley also addressed the meeting.

THE annual examination of the Carpenters' Company for shop and outdoor foremen, &c., took place at the Company's Hall, in London Wall, and at their Technical Schools, in Great Titchfield Street, during last week. The usual course of lectures, given for the benefit of the candidates during the previous weeks, had been very numerously attended. These lectures are delivered by professors of Architecture and engineering, and other eminent men. The number of candidates who entered for the examination was well up to that of the last two years. The average number of marks gained was in excess of that of any previous year, showing that each year a higher standard is reached. The Carpenters' Company was assisted by the usual Board of Examiners. The names of the successful candidates in order of merit are:—First Class: Jno. Crewdson (gold medal), W. H. Betambeau and F. Hartnoll (silver medal), W. B. Sweett (bronze medal), J. Packham, T. E. Kinch, G. M. McCorquodale, and J. H. Davies. Second Class: W. J. Barnes, W. J. Collins, Ernest White, A. H. Walker, G. H. Griffiths, H. S. Jones, G. W. Adkins, A. H. Imber, A. Norton, W. Wintersgill, W. Forth, G. W. Filby, C. R. Tinson, A. Pringle, and F. J. Griffiths. Candidates already holding the Company's certificate who came up to improve their condition and failed to do so, do not appear in this list, although they may have maintained their former position.

THERE is a big gap in Fleet Street now, where once stood the banking house of Messrs. Gosling and Sharpe, under the sign of the "Three Squirrels," and next to the "Palace of Henry VIII. and Cardinal Wolsey," otherwise the barber's. The old building, itself the successor of older ones, all of them bearing the cognisance of the "Three Squirrels," is gone; another, more roomy and probably much handsomer, is to rise on the same site. Fleet Street is a busy street; not one where people have much time to stand and look about, but a bustling thoroughfare where archaeological curiosities are the last things which the passer-by would expect or wish to arrest his attention. Few, therefore, of the thousands who daily passed up and down along the south side of the street ever noticed the three little iron squirrels on the bars of one of the ground floor windows of Gosling and Sharpe's Bank, and few ever observed the strange wooden sentry-box which was flattened against the wall. But those three squirrels were there, in the same place, but in a quaint building, over three hundred years ago; and from that sentry-box, in the days when the police regulations were extremely defective owing to the fact that there were no police to speak of, the watchman (with a stout cudgel) kept an eye on the door of the bank and took stock of its customers. He was there for the purpose of raising the hue and cry, and no doubt also assisted in the chase of any ill-conditioned varlet who might have gone off with Gosling and Sharpe's spoons. Gosling and Sharpe's bank, as one of its recent historians relates, is one of the very oldest in the City of London. Exactly how old is not known.

WE understand that Mr. Akers-Douglas has asked Professor A. H. Church, F.R.S., who has just presented to the Office of Works some further memoranda concerning the wall paintings in the Palace of Westminster, to advise as to the steps to be taken to carry out his further recommendations on the subject.

These have not yet been published, but they suggest that during the summer of 1899 the frescoes in the House of Peers should once again be cleansed under his supervision, and that the four glazed corridor paintings, "The Burial of Charles I.," "Charles I. Erecting his Standard at Nottingham," "The Parting of Lord and Lady Russell," and "The Last Sleep of Argyll," should be so treated as to remove all their present disfigurements, such as the grey film and the numerous dark, circular patches, possibly of fungoid origin, which are increasing on various parts of the surface of one of the pictures. The professor adds that, in his opinion, it will be necessary to repeat the cleansing operations in regard to Maclise's famous picture in the Royal Gallery every third or fourth year, and recommends that a similar course should be adopted in the case of the five frescoes in the Queen's Robing Room.

ONCE more the London County Council blocks the way—this time, says the Electrician, to a useful and much-needed development of electric tramway traction in London. Blind alike to the success of the overhead trolley system in every civilised part of the globe, and to the urgent need for improvement in the scarcely civilised transportation arrangements of the first city of the world, this so-called "progressive" body has been pleased to veto every proposed introduction of the trolley system within the area it controls. On Wednesday last the committee appointed to consider the London United Tramways Bill decided not to dispense with the regulation that consent must be obtained from the London County Council as to the form of traction; although, it seems, they are strongly of the opinion that the congested state of London makes the speedy adoption of electric traction on tramways necessary. The pointed hint to the London County Council to come to a reasonable arrangement with the tramways company will, we trust, not be without good effect.

THE Council of the Architects' Benevolent Society have just issued their annual report in a pamphlet, which also includes the list of donors and annual subscribers, bye-laws, statement of accounts, etc. The amount received in annual subscriptions during the year was £456 10s., and, with recent additions to the list of annual subscribers, the total number now reaches 300. The Council feels that this number, however, is not sufficiently representative of the large body of Architects practising in the United Kingdom, and in pointing out that the usefulness of the Society would be increased in proportion to the augmentation of its list of subscribers, the Council remind those who have withheld their hand that an annual subscription of one guinea has the privilege of recommending two applicants for grants during the year. The capital account of the Society has been increased by the bequests of £100 each of Mr. David Mocatta and Mrs. Ann Mocatta, and by the following donations:—The Merchant Taylors' Company, £21; John O'Gaunt Sketching Club, £15 1s. 7d.; Mrs. C. E. Barlow, £12; Mr. Wm. Emerson, £6 13s. (thus bringing the total amount of his donations to £100); the Nottingham Architectural Society, £5 5s. Applications for relief during the year were more numerous than usual, and after proper investigation in each case, the sum of £607 15s. (as against £569 10s. in 1896) was distributed to forty-three applicants; and £70 was paid to the Society's three pensioners. It is proposed—as the invested capital of the Society reaches £10,000—to increase the present list of three pensions of not less than £15 a year each to six pensions of not less than £20 a year each. Thus the good work of the Society is reaching further afield year by year.

A MISCELLANEOUS collection of objects of Art produced some good prices at Christie's, when an Elizabethan jug of mottled brown stone ware, mounted with chased silver, fetched £215; a large Norwegian silver-gilt tankard, £69; and a pair of Queen Anne silver table spoons, with chased bowls and flat handles, sold at £3 8s. per ounce.

STRUCTURE AND PROPERTIES OF TIMBER.*

By GEORGE ELLIS.

IN dealing with the structure of wood I do not propose entering elaborately into scientific differences of cellular tissue, or the mysteries of protoplasmic growth; but rather to give you a general idea of the constituent construction, and deduce, therefrom, explanations of sundry characteristics that will be familiar to all of you, and which may possibly prove of some little service in your business. First, I must explain that my remarks are confined to exogenous trees. As you are probably aware, botanists divide the trees of the world into two great classes, or genera, according to the method by which they increase their growth; those which increase by development of cells within earlier growth are termed Endogens, those that do so by deposits upon the outside of former layers, are Exogens. It is from this latter class that the timber used for constructional purposes, at least in the Northern Hemisphere, is solely derived. These are again generally sub-divided into hardwoods and softwoods, a very arbitrary distinction, as many of the so-called hardwoods are actually and comparatively softer than some of the softwoods. The softwoods are all resinous, and are drawn from the order Coniferae: this name refers to the cone-shaped seed vessel which they bear. The hardwoods are mainly non-resinous, and with acrid or aromatic secretions. These are drawn from the order Dicotyledons, which have two similar lobes in their seed vessels, and their germinal leaves in pairs. A piece of timber from one of these trees may be described as composed of

A VAST NUMBER OF EXTREMELY MINUTE TUBES,

arranged in more or less regular rings around a central shaft—the medullary sheath, containing the pith cells. These tubes vary in size and shape, as their functions and the kind of tree. They are disposed vertically, or, rather, in the direction of the length of the stem, and are usually spoken of as vascular bundles, i.e., bundles of vessels. Each tube is divided horizontally into cells of varying size, but always many times longer than wide. In some of the conifers these cells are of extraordinary length, having been traced for many feet without the discovery of a partition. These bundles of pipes or tubes, when viewed collectively in cross section, form the concentric bands called annual rings. Interspersed between the bundles, in a radial direction, are numerous narrow bands of cells that have the appearance in longitudinal section, of low walls running from the outside of the tree towards its centre. These are the medullary rays. Finally, circumscribing all, comes the bark, also formed of several layers of cellular tissue, the component cells of which are very much narrower in a radial direction than those composing the interior substance, and laid, as it were, like bricks in stretching bond, around the circumference. If we examine these various series of cellular tissue a little closer, we shall find that there are great differences in their appearance, compositions and functions. But to make the description clearer I will first briefly describe the process of growth in a tree. When a seed commences to germinate, it first pushes a root downwards into the earth, and then a stem upwards into the air. The root develops rapidly, throwing out lateral shoots on all sides; it is formed very similarly to the stem, and its tissue eventually becomes continuous therewith. The stem, consisting first of the pith and epidermis, the latter a primitive and temporary covering, eventually superseded by the cortex, is formed of cells that are continually dividing within themselves, but vertically much faster than laterally, obviously if it were not so, first the plant then the stem of the tree would be thicker than high. As each cell divides, fed by the solutions absorbed

by the roots from the soil, it goes on increasing in size until the daughter cell is as large as the mother cell, when that in turn divides, and so on continuously. After a time the ends, if I may so call them, of the superimposed layers of cells get absorbed, the walls coalesce, and a tube results. The active cause of the upward flow of the fluids through root and stem is primarily, leaf formation, these soon develop, and are built up, like the rest of the plant, of

VARIOUSLY ARRANGED CELLULAR TISSUE.

The mineral salts and other solutions, formed by rainwater, passing up the tubes of the pith, on reaching the leaf surface undergo sundry changes in their composition, due to the action of the air and sunlight, so that the cell growth of the leaf, penetrating downwards into the stem, becomes much denser and fibroform, producing the lignine or woody matter of the plant. Eventually the increased girth of the stem becomes too great for the fluids to be supplied through the central cells of the pith column in sufficient quantity, and they gradually go out of use and dry up; their office being taken up by the outer layers of tube vessels, which then become the conduits of the sap: as the diameter of these layers increase, and generally one complete ring is formed each year; they, of course, recede further and further from the centre, and some other means are required for the irrigation of the interior. This is supplied by the formation of medullary cells, which push their way through from the outside cambium towards the pith; not by the penetrating walls of the vascular tubes, but by wedging themselves between two contiguous rows, thus forming conduits for the descending sap of the leaves to the interior tissues. The next important change that occurs is that the inner rows of tubes near the pith get filled up with solid matter, deposited by the returning sap as it infiltrates through them to feed and increase the tap root, because you must understand that the sap movement is a circulatory one, ascending during the spring in the form of a thin watery fluid—active for vascular growth by way of the sapwood of stem and branch into the leaves, where in that natural laboratory it undergoes sundry chemical changes, then descending during the autumn heavily charged with saccharine matter by the way of medullary rays, and interior wood to the root system, forming ligneous and fibroform cells. The more fluid portion of the descending sap flows down between the libra or internal cells of the cortex, and the loosely-formed spring tissue of the stem, depositing thereon a relatively thin layer of dense, thick walled cells, forming the dark zone in the annual ring. A similar but still

FINER ZONE OF CELLS

is deposited upon the spring growth of the libra, which I have indicated in my drawing under the name of bast cells. When an inner layer of vascular tubes gets charged with solid secretions, it becomes heartwood, and is, so far as the power of increasing itself is concerned, practically dead; it then, however, is the perfect wood for man's use, and remains in much the same condition until the tree reaches maturity, when decay usually commences. Annually, as new layers of cells are developed from outside the sapwood (this active part being known as the cambium, or growing tissue), some of the inside layers of the sapwood get filled up, producing heartwood. The cambium develops cells of various kinds; some become vascular tissue, some medullary rays, some libra, or inner bark, in some cases cork, bast fibres, &c. The causes which produce the various forms of cell have not yet been determined. These cells contain protoplasm, nuclei, and starch grains. It is difficult to explain in a few words what the protoplasm is, but it may be defined as the life-giving substance of the cell, and it is in a constant state of circulation around the nucleus in each cell whilst the tree is standing. The starch grains seem to be its food, and are derived from the sap. Towards winter the cells become heavily charged with starch granules, for the purpose apparently of affording nutriment to the protoplasm whilst vegetation is dormant. The larger cells are termed tracheids—pine and other conifers are

mainly composed of this variety; their walls are dotted with minute depressions called bordered pits, whose presence is intimately associated with the raising of the sap. Between them are spiral vessels and woody fibre. The spiral vessels are tubes of nearly circular section, their walls formed of thread-like membrane wound around as a helically ascending screw. A thin band of these vessels comprise the first-formed layer of heartwood, termed the medullary sheath, and it seems very probable that it is mainly to the isolating action of this band that the destruction of the pith cells is due. The wood fibres are long narrow cells with small lumina (as the space between the walls is called), thick walls with pointed ends, and the radial sides pierced with numerous fine, slit-like openings; it is to the presence of these fibres that the toughness of the wood is due, they are among the products of the descending sap. Other vessels more intimately connected with the spring growth of tissue, are large ovoid tubes with walls thickly covered with simple pits, their lumina always filled with watery fluid; these are distinguished as pitted vessels, and wood-parenchyma vessels; that have the peculiarity of retaining their cellular formation intact, as do also the medullary rays. The

CELLS OF THE MEDULLARY RAYS,

have very hard or horny walls, and they not only connect the cambium with the pith as canals, but also act as stays to strengthen the vascular tissue. This is, of course, but a very incomplete explanation of the various processes of growth, &c., but time will not permit of my going further into the matter, and I think that I have said sufficient to render easier of comprehension, sundry phenomena displayed by timber, when subjected to ordinary conditions of building. Perhaps the most familiar of these that I may refer to are the clefts that occur in drying, called shakes. When a tree is cut down, its fluid contents soon commence to evaporate, if it is of considerable size, or is approaching maturity, there will be a large proportion of heartwood, with its pith dried up and loose; this will afford access to currents of air into the very heart of the tree, drying out the moisture, and producing cleavages, in the planes of the medullary rays—as that is the direction of least resistance, because the partitions of medullary cells, acting like wedges between the rows of cellular tubes, have a tendency to produce rupture there. This cleavage is greatest at the heart, diminishing off to a hair line as it approaches the sapwood; and is technically known as a Heartshake. If on the contrary, the tree is young, containing much sapwood, and is barked immediately on felling, the outer layers, containing relatively more watery matter, dry more rapidly than the inner; the walls collapse and numerous small fissures occur in the direction of the annual rings; these appear in the boards as Deep shakes, and are very detrimental; occasionally the fissures will be radial, producing flat shakes in the converted stuff. These are sometimes, when extensive, confounded with the star shake, which is, however, a defect of the living tree, and is produced before it is felled. The Star and the Cup shake are varying results of the same cause, which I will explain to you. As I have before mentioned, the heartwood of the tree is to all intents dead; therefore when in the spring the sapwood, becoming charged with moisture and influenced by the activity of the cambium cells, extends itself circumferentially, the inert heartwood does not respond, and in many instances

A RUPTURE TAKES PLACE

between the growing and the finished rings, resulting in a Cup shake, that may or may not extend throughout the entire circuit of a ring. More frequently, however, it happens that the adhesion of the annual rings to each other proves stronger than that of the component bundles of vascular tubes, and the effect of the expansion is displayed in a number of clefts along the medullary planes, and converging on the centre, thus producing the Star shake. You will see by this that the essential difference between a Heart shake and a Star shake is that the former, fully developed

* A paper recently read at a meeting of the British Institute of Certified Carpenters.

at the centre, dies off imperceptibly as it reaches the sapwood, whilst the latter, more pronounced at the circumference, diminishes gradually as it penetrates towards the heart, which it but seldom reaches. Incidentally a Cup shake affords evidence that the viscid secretions of the tree travel by way of the medullary rays, because the ruptured ends of these are always marked by masses of exuded resin, etc., and frequently the entire cleft is thus filled. Another familiar property of converted timber, that of warping, is rendered plain in the light of the previous explanation of its cellular structure. When a board is cut, tangential to the annual rings—that is, parallel to a plane passing through the centre of the tree—it will warp in seasoning, however it may be secured, and observation will have taught you that it will always cast hollow on the side nearest the outside of the tree. The reason is to be found in the differing density of the heartwood and the sapwood, the latter open and loosely constructed, its tubes filled with air or fluid matter close in greatly on the drying out of their contents; those of the heartwood, filled up with solid secretions, scarcely alter in the process. Now, a board cut as I have described will have much more sapwood upon its outer face than upon the side nearest the centre; therefore the effect of the closing in of the cellular tissue will be more apparent on that side, in other words, the side containing the more sapwood will become narrower than the other side. The medullary rays also contribute to the warping action in that they collapse sideways, but preserve their length intact. So that if you want a board

TO SHRINK EQUALLY ON EACH SIDE

and so remain flat, it must be cut radially, that is, with its face parallel with a medullary ray. And you may easily discover if a board has been so cut, by observing the direction of the annual rings at the end; these should be parallel to the edge, or square with the face of the board. Some trees bend much, when young, or get twisted by the wind, but become straight and regular on the outside when older; the heart, however, will always retain its sinuous or twisted course, and boards cut from such a tree will be of no use for joinery, as nothing will prevent them winding when drying. The reason is that the plane of cut does not pass through the same annual rings throughout the length of the tree, and one portion of the board will be of much older wood than the other, and consequently its shrinkage can never be regular and equal. Sapwood, besides being comparatively weak, is from the nature of the contents of its cells extremely subject to the attack of animal and vegetable enemies; directly the tree is cut down, and the motion of the sap ceases, microscopic worms and fungi enter and commence its destruction. The bluish, or greenish, tint which the sapwood of pine and deal assumes, after a short time, is due to the presence of a fungoid growth in the cells. The freedom from similar attacks which the spruce seems to enjoy is probably due to the antiseptic action of the tar in its secretions. A Knot is the point of juncture of a branch with the parent stem, and its hardness and cross grain are due to the interruption of the downward flow of the sap, which, failing to find a continuous channel in the direction it has hitherto pursued, divides, and wells round the upcoming cambium of the trunk. Its delay causing a concentration of the solids of the sap at this point, the surrounding wood cells get surcharged, and are hard and brittle. This want of continuity, or swaying round of the fibres, renders the wood weak at the points

WHERE KNOTS OCCUR,

and the larger the knot, the more the defect is intensified, which is a sufficient reason for rejecting baulks with many large knots for weight-carrying purposes. They are equally to be avoided in boards for joinery, as in addition to their weakness, there is great difficulty in preparing their surfaces smooth, or preserving paint from the solvent action of their abundant secretions. The disposition of the knots in a plank will pretty accurately

indicate the species of tree from which it was cut. If they are gathered near the centre or pith it will probably be a conifer, as the branches of these trees take their rise directly from the pith column; if distributed near the outside it will be a hardwood, as these branches spring from the outer side. The pines may be distinguished from spruce or fir by noting the relative position and shape of the knots. In the fir they will be in clusters, very small and numerous, with a few scattered ones between the nodes. In the pines they will be large and disposed regularly, in each side of the centre, with long, clear internodes. The branches of the spruce stand out nearly at right angles with the stem, and, consequently, the knots appear on the surface of the boards as nearly circular discs, or lie in obtuse angles with the centre. The pines are of closer habit, their branches shooting upwards, and the knots appear elliptic in section, making acute angle with the pith. European pine may be distinguished from American by the translucency of its knots, and their moist, bright reddish appearance. The latter are hard, opaque, and dry.

KEYSTONES.

AN iron church has been built in the parish of Walmsley, near Bolton.

A new infant school is being built in Holland Street, Manchester. The building will cost £2300.

A MISSION CHURCH has been built in the parish of St. Mary's, Lancaster, at a cost of over £1500.

LADY FARQUHAR has opened a new church institute, which has been erected in connection with St. Stephen's Church, Portland Town, Marylebone.

A HANDSOME new chapel at Mill Hill School, Oxford, was recently opened. The new chapel, which is from designs by Mr. Basil Champness, cost £6000.

THE Street Improvement Committee of the Bradford City Council have decided to recommend the Council to take over Brewery Street, and to make the footpath thereto an ordinary road.

THE ironwork portion of the East Pier of the Dover harbour extension works has now been entirely completed. The stonework has attained a length over 1600ft. out of the 1950ft. it is to measure.

PLANS have been prepared to extend the west end of Carnforth parish church and provide additional accommodation at a cost of £3000. It has also been decided to build a new parsonage at a cost of £1200.

EARL NELSON has laid recently the foundation-stone of a new tower which is being erected in connection with the extensions and improvements at the ancient Church of St. Peter, Derby. The work is to cost £6000.

AN extensive church scheme is being undertaken in the district of Ewood, Blackburn. It is proposed to form a new parish chiefly from Christ Church parish, but it is also proposed to detach a certain part from three adjacent parishes. New schools have already been built at a cost of £3300. A site has been purchased for a new church at a cost of £740.

THE Plymouth Corporation Finance Committee has held a special meeting to receive plans prepared by the City Engineer for the new temporary council chamber, which the Council had decided should be erected at a cost not exceeding £2500. The plans, which embodied alterations suggested by the committee at a previous meeting, were approved, and instructions were given to proceed with the work.

VISCOUNT POWERSCOURT'S collection of drawings by Thomas Rowlandson sold at Sotheby's, in separate lots, for the aggregate sum of £200, an average of about £2 each, but only a few of the drawings brought prices over £5. "Exhausted Gamblers" (the old card-room at Brooks's Club) went for £12 12s.; "Hopkins's Repository, Barbican" (a horse sale), for £9 9s.; "Launceston Market Place—Recruits on Parade," £9 5s.; "The Swing," for £12 15s.; and "Dinner Time with the Vicar and with the Curate" a pair, £6.

Professional Items.

ABERDEEN.—The flooring of St. Mary's Chapel, East Parish Church, has been begun. It has been decided to employ a different material for a portion of the floor. This is a number of old flat tombstones, which have been lying in the churchyard, or on the pathway near the church, or stored in out-of-the-way corners since their removal from the interior of the church when the latter was rebuilt. Some of the tombstones are sculptured, and on some of them it is possible to make out clearly the inscription. There is, for example, a finely-sculptured tomb of Peacock. There is another of Gilbert Harvey, and a third of one Alexander Cushny. People might naturally be somewhat startled on hearing of gravestones being taken from the churchyard to floor the chapel. It is explained, however, that not one of the stones has been taken from a grave. That is to say, the stones had at one time been moved from the graves of the persons whom they commemorate, as is shown by a reference to the registers of burials, and it is urged that the course now taken is for the preservation of the stones from the destruction which would otherwise overtake them.

Plans prepared by Messrs. D. and J. R. McMillan, architects, Aberdeen, for the proposed new Free Church at Fochabers have now been sanctioned. A site has been found on the side of the main road leading to the Square. In design the structure exhibits little or no departure from the conventional modern type of ecclesiastical buildings. It is cruciform in shape, the interior consisting of nave, apse, and two transepts. The feature that first arrests the eye is the tower and spire, a fine structure of shapely proportions, over 100ft. in height. It is supported by heavy buttresses, carried up from the base and finished off at the four corners with neat turrets, capped with artistic terminals. The church proper is in the early English Gothic style of Architecture, with the heavily buttressed walls and pointed arched windows that are characteristic of it. In the gable facing the highway is a Gothic window of handsome proportions, which forms a distinctive feature of the building. The main entrance is in the tower, and there are doors in both transepts and at the rear. The masonry will be of sandstone. Internally, the church is to be arranged and finished according to modern ideas.

BIRMINGHAM.—The scheme for providing a new Police Institute for Birmingham is at last assuming more practical shape. The foundation-stones of a centrally-situated building were laid last week. The plot of land on which the Institute will stand is at the corner of James Watt and Dalton Streets, and the building will be an imposing one. Within the walls will be found a gymnasium, baths, smoking and recreation room, assembly hall, library, and reading-room. The building is being constructed by Mr. T. Johnson, contractor, of Great Brook Street, from the plans of Messrs. Ingall and Son, architects, Temple Row, at an estimated cost of £6360.

CASTLETON.—New Wesleyan Chapel and Schools at Castleton, in the Bradwell Circuit, have been opened. The premises supersede a smaller building that has done duty for chapel and school purposes nearly a hundred years. The plan of the building provided for a nave 55ft. long by 33ft. wide, one transept 30ft. by 22ft., class-room 15ft. square, and vestry. The local limestone has been used for the walling, with Stoke Ashlar facings. The roofs are covered with green Westmoreland slates. There are in the east and west gables five light windows with traceried heads, and the nave is further lighted by five two-light windows with arched heads. The entrance porch in the angle has an arched doorway with moulded and panelled buttresses, and carved spandrels. The roof is open as high as the collar beam, and is framed with hammer beam trusses springing from carved stone corbels, and filled in with tracery. The easternmost bay is raised and divided from the rest

of the nave by an ornamental screen, behind which is the communion space with table and reredos, and the organ and choir stalls. Mr. H. W. Lockwood, of Sheffield, has been the architect, and the contractors have been, for masonry, Mr. Jas. Fidler, of Eckington; for woodwork, Messrs. Wheat and Son, of Castle-ton; for slating and plastering, Messrs. Chas. Chadwick and Sons, Sheffield; for plumbing and glazing, Mr. George Rusling, of Sheffield; for painting, Mr. Roe, of Castleton; and Mr. Frank Tory, of Sheffield, has done the carving.

CHELMSFORD.—Messrs. R. E. Crompton and Co.'s electrical engineering works at Chelmsford, which were entirely destroyed by fire, have been rebuilt. The works, which externally have nothing to boast of from an architectural point of view, cover an area between eight and nine acres, the main shop occupying over three acres. This building is very lofty, well lighted and ventilated, and at any time can be easily extended towards Chelmsford. Adjoining this main building is the smith's shop, and close at hand are other shops, where the different processes of the manufacture of electrical machines are carried on. The Company has its own water supply and sewage works, the sewage being electrically treated. A large reservoir has also been constructed on the lower portion of the grounds.

DENABY MAIN (YORKS.).—At the mining village of Denaby Main, a Roman Catholic Church, erected at a cost of about £3000, has been consecrated. Stone from local quarries has been used by the contractor, Mr. Frank Robinson, of Thornton, near Bradford, under the direction of Messrs. Empsall and Clarkson, the architects. The church is lofty, and is well ventilated, lighted, and heated. The work has been attended to by the following:—Joinery, Messrs. Broadhead and Pickering, Bradford; plumbing, Mr. Lindley, Leeds; plastering, Mr. Andrew Taylor, Eccleshill, near Bradford; slating, Mr. Thornton, Eccleshill; painting, Mr. Walton, Frisinghall, Bradford.

DUBLIN.—St. Thomas's Church, Marlborough Street, Dublin, was founded in 1758, and the dilapidation inseparable from age, which, to a noticeable degree, has latterly made itself evident, has rendered restoration necessary. Extensive works are contemplated in connection with the roof, ventilation, heating, floor, tiling, the chancel, the windows, and the front of the church, and it is proposed to complete the original plan by the erection of a granite pediment, and to place the front, doors, railing, and pavement in thorough repair.

GLASGOW.—The memorial stone of the new Queen's Cross Free Church, Glasgow, has just been laid. The new church is situated at the corner of Garscube Road and Springbank Street, and is designed in a free treatment of late Gothic style, all the work being of a most substantial and thorough character. The principal feature is a tower of robust proportion situated at the corner of the street. This is flanked in Springbank Street with the window of the choir chamber, the sill of which is at high level, and in Garscube Road by the transept gable. The main body of the building is so arranged as to give an uninterrupted view of the pulpit. The passage from the main entrance, which is situated in Garscube Road, is a narrow aisle, from the inside piers of which the roof principals spring. A transept and back gallery are provided, and there are four exit doors. The pulpit is placed at the side, and accommodation is found for the choir and organ chamber at the side of and behind the pulpit. Messrs. John Honeyman and Keppie are the architects.

Wellfield United Presbyterian Church, Springburn, the foundation stone of which has just been laid, is at the corner of Balgray Hill and Murdoch Street, and extends back to Sutherland Street. The very rapid fall of the ground on the hill side has added considerably to the difficulties of planning, there being a difference of over 27ft. between the levels of the back street and the lower point on Balgray Hill. To meet this, the hall has been placed

facing Sutherland Street, on the higher level, and entering from Murdoch Street, the rooms, vestry, session-house, &c., on an intermediate level, while the church occupies the corner of Murdoch Street and Balgray Hill, with entrance from both streets. The main entrance faces Balgray Hill. Internally the church is planned with nave and side aisles, which are separated by moulded stone arches carried on splayed stone piers. There are galleries at sides and end, but the galleries are kept back behind the line of the stone piers, allowing these to be carried up in an unbroken line. Above the piers attached stone shafts are carried up, terminating in carved caps, from which spring the principal roof couples. The pulpit will be placed under a wide stone arch at the eastern end, and on each side, under smaller arches, an organ chamber is arranged. The hall is 54ft. long and 28ft. broad, and there are two large classrooms, which can be opened into one, forming a lesser hall for 100 persons. The style of Architecture is Gothic of the late decorated period, and the principal feature externally will be the tower and spire, which will be over 100ft. high. The lower stage is carried up square to the belfry chamber, where the plan becomes octagonal, with projected buttresses at the angles of the tower. The principal front to Balgray Hill has the main gable in the centre, flanked by the tower on one side and a projecting staircase on the other. The mason work is in red sandstone, and is already well advanced, the memorial stone being placed in the western face of the tower at the gallery floor level. The number of sittings provided is 808, and the expected cost of the whole scheme is about £7200. The architect is Mr. John B. Wilson, Glasgow, and the following are the principal contractors:—Mason, H. Nelson and Co.; wright, Thomas Brown; slater, Thomas Muir; plasterers, J. and A. Williamson; plumber and gasfitter, Thomas Munro; glazier, Joseph Miller; and painter, A. Stirling—all of Glasgow.

INVERNESS.—The Station Hotel has been remodelled. The work of construction was entrusted to Messrs. Ross and Macbeth, architects, Inverness. The principal town entrance to the hotel is now situated in the Station Square, in the corner of which a handsome stone porch has been built. This porch is a splendid piece of work, and gives an elegant and finished appearance to the whole block. It has in front massive columns surmounted by an ornamental balustrade, over which is a shield with the arms of the Highland Railway Company. Immediately inside the porch is a large and beautiful entrance hall, which with its tiled floor and tastefully panelled walls has a most effective appearance. From this hall a wide staircase branches right and left to the first floor, which is occupied by bedrooms and sitting-rooms. Similar staircases lead to the other floors, where also are bedrooms, service rooms, &c.

IPSWICH.—The foundation-stone of the new St. John Baptist's Church, Ipswich, was recently laid. The new edifice will cost in erection about £8000. Sir Arthur Blomfield, A.R.A., was consulted, the first idea being to enlarge the present church, but it was decided that the more satisfactory method would be the construction of an entirely new edifice. Sir Arthur Blomfield accordingly prepared the designs. The outer and interior walls will be of red brick, with Monk's Park stone dressings, the roof being of pitch pine, with Broseley tiles. The interior will consist of a nave and side aisles, a clergy vestry at the north-east corner, communicating with a choir vestry, and underneath will be a heating vault, for warming the church by means of hot-water pipes, passing under gratings in the wood-block floor. At the opposite corner will be the organ chamber, the chancel being situated midway, and the east window, with five lights and Gothic top, will face the roadway. There will be four entrances—two on the west side of the baptistry, one at the south-east corner, and one by the clergy vestry. The roof of the nave will be supported off the clerestory walls, and the pillars dividing the nave from the

aisles, which are 91ft. by 12ft. 7in. in dimensions, will be of red brick, alternately circular and octagonal. The chancel, 36ft. by 25ft., will be approached from the nave, which is 91ft. long by 28ft. 6in. wide, by four steps, and will be designed in red and black tiles. There will be one step from the chancel to the Communion table, on the south side of which will be a sedilia, of Monk's Park stone, with marble shafts. Cathedral glass will be utilised for the windows. A four-light window at the west end will be placed immediately over the roof of the baptistry, and this portion of the façade will be completed by a bell-turret, with provision for two bells and a weather vane. Ample accommodation will be provided in the vestries—that for the choir being 16ft. square, and that for the clergy slightly smaller. The space allotted in the organ chamber is 18ft. by 11ft. 9in. The pulpit will be carved in oak, the font being of stone, with marble shafts. Only a portion of the body of the church is to be constructed at first, providing seating accommodation for about 600.

A new Liberal Club has just been erected in the Stoke district of Ipswich. The site selected was in Austin Street. The club premises are compact, and are, as it were, in two portions, divided by a corridor. On the right side of the entrance are the games room, the billiard room, and the reading room, in the order named, each spacious and very lofty, and divided from one another by partitions, which, being removed, convert the three into one long room 52ft. by 20ft., to be used as an assembly room. On the left side of the entrance is the refreshment bar, a roomy apartment, and the back of the bar communicates with the steward's rooms, which are a compact block distinct from the club proper, with separate offices. The building of the club was entrusted to Mr. Edgar Catchpole.

LEEDS.—A new Sunday-school at Oxford Place Wesleyan Chapel, Leeds, is being completed. The old Sunday-school was insanitary and ill-adapted for the work to be done in it. The possibility of effecting an improvement was not considered; the building was pulled down, and Mr. G. F. Danby and Mr. W. H. Thorp, architects, Leeds, who are also responsible for the refacing and re-modelling of the chapel, were called upon to furnish designs for a new school. In the new building there are two main floors. The ground floor, on the same level as the chapel, and having direct communication with it by means of a well-lighted corridor 6ft. wide, includes a large lecture-hall with sitting accommodation for 240 infants, five classrooms, and a caretaker's living room; whilst there are also separate entrances for boys, girls, and infants. The upper floor is approached by two well-lighted stone staircases. On this floor is the schoolroom, which has an open timber roof 26ft. high, and is a most cheerful apartment. Ten classrooms have access to the schoolroom. The upper floor has communication with the gallery of the chapel. In the basement is a kitchen, storerooms, heating apparatus, and other conveniences. The whole of the building is well lighted with electricity. The total cost has been £26600. The contractors were Messrs. W. Thompson and Sons, Mr. G. Thompson, Mr. H. Pearson, Mr. Thos. Harrod, Messrs. Holmes and Co., and Messrs. J. and H. Smith.

LINCOLN.—The foundation stone of a new school-chapel in connection with the Newland Congregational Chapel, Lincoln, has been laid. The complete scheme will entail an expenditure of about £2000, but the present portion will involve about £1400. The building, of which Mr. J. H. Cooper is the architect, will be of brick, with Ancaster stone dressings. The contractors are Messrs. H. S. and W. Close.

MANCHESTER.—The Duke of Devonshire, as president of the Owens College, visited Manchester for the purpose of performing two important functions at the College. These were the opening of the handsome new library building, the gift of Dr. R. C. Christie, and the laying of the foundation-stone of the new Whitworth Hall. This building, like the

library, is to be from designs by Mr. Alfred Waterhouse, the original architect of the college buildings. It is to afford a hall large enough for all ceremonial purposes connected with the college and Victoria University, and will communicate with the Christie library through a covered cloister, the library being in turn connected with the main building by means of a bridge. The hall will be 120ft. long and 50ft. wide. The dimensions of the Christie library are: length, 100ft., width 46ft.; height to the top of the parapet 46ft.; and to the ridge of the roof 73ft.

NEWCASTLE, IRELAND.—The Slieve Donard Hotel, Newcastle, Ireland, was opened a few days ago. The establishment, which has been constructed and equipped at a cost of some £80,000, is in every way worthy of the splendid site upon which it stands. The architect is Mr. J. J. Farrell, Dublin; the contractors being Messrs. H. and J. Martin, Belfast, and the clerk of works Mr. Matthew Robinson.

OLDBURY.—A meeting has been held at the National Schools, Oldbury, for the purpose of considering a scheme for the renovation of the parish church. Mr. Ewood, Architect, of West Bromwich, submitted plans for the renovation and alterations of the church at an estimated cost of £658. The plans were approved.

OSWESTRY.—The memorial stones have been laid of the new Primitive Methodist Chapel at Oswestry. The design is by Mr. J. D. Mould, F.R.I.B.A., of Manchester, and the work has been carried out by Mr. Jabez Higgins. The extreme length will be 69ft., the width of the nave 36ft. 8in., and on each side there will be transepts. The end facing Chapel Street will be apsidal. The west end will contain a large stone-traceried window, which will be flanked with massive buttresses. There will also be traceried windows in the transepts. The building, which will be in Perpendicular Gothic, will have a battlemented tower at the entrance corner, surmounted by a spire.

RIPON.—Ripon received a very handsome addition to its architectural features last week in the presentation to the Mayor and Corporation, on its behalf, of what is known as the Victoria Clock Tower, which has been erected at the junction of the Palace and North Roads. The building has been erected from the designs of Mr. George Corson, of the firm of Corson and Jones, architects, Leeds. The structure is 10ft. square, and rises to a height of 43ft., culminating in a Crown Imperial in copper. The finishing of the tower is rather unique. On the angles are four octagonal buttresses, which rise above the parapet in pinnacles, with carved finials and crockets. From these spring four flying arches or buttresses, and from four smaller pinnacles, corbelled out over the dials, spring other four. These eight unite in a keystone or carved boss, which carries the stone terminal on which the Crown Imperial rests. Of this manner of finishing a tower there are few examples. The principal ones are those of St. Giles's Church, Edinburgh (eight ribs); King's College, Aberdeen (four ribs); the Tron steeple in Glasgow, and one at Newcastle. Formerly there was one at Linlithgow and one at Haddington. There are four dials enclosed within circular moulding within squares, the spandrils carved. On the stage below that of the clock the statue of the Queen occupies a canopied niche on the side fronting the city. The stone used in the building is from the Dunhouse Quarries, near Darlington, the builders being Messrs. W. Wilson and Sons, of Headingley. Messrs. Potts and Sons, of Leeds, have provided the clock, with its four illuminated dials.

WOODBIDGE.—A handsome window has been placed in the town church of St. John. The window, which is situated on the north side of the fine old church, near the chancel, is an extremely fine example of glass staining, the artist being Mr. A. L. Moore, of Russell Square, London. The design, in itself, is very appropriate, depicting in three lights the patron saints of the three countries.

Under Discussion.

ARCHÆOLOGISTS AT PETERBOROUGH.

Peterborough is to be the locale this year of the annual congress of the British Archæological Association, to be held from July 14 to 20. The congress will meet at the cathedral in the afternoon of July 14, and will be conducted over the building by the Dean, after which a perambulation of the city will be made. On the subsequent days visits will be paid to all the places of interest in the locality, including the famous house of Burleigh.

SCOTTISH SANITARIANS IN CONGRESS.

The Sanitary Inspectors' Association of Scotland recently visited Perth for the purpose of holding their annual congress. The annual business meeting of the Association was held in the Commissioners' Hall, Mr. Kenneth Cameron, Chief Sanitary Inspector, Aberdeen, the president, in the chair.—The president was re-elected, as were also the vice-presidents—Mr. Alexander Hay, County Sanitary Inspector, Lower Ward of Lanarkshire, and Mr. Robert Lindsay, County Sanitary Inspector, Mid-Lothian. Mr. George Dunne, Chief Sanitary Inspector, Govan, was re-elected secretary and treasurer. The report by the secretary was submitted, which stated that a number of amendments prepared by the Council of the Association had been accepted and were embodied in the Public Health (Scotland) Bill, which came into force on January 1st. During the year nineteen inspectors joined the Association, and six withdrew on resigning office. The number of members on the roll is 165—92 chief inspectors and 73 assistant inspectors. The funds of the Association continue in a satisfactory state.

THE PRIORY OF INCHMAHOMIE.

The Glasgow Architectural Association held its annual excursion on Saturday, 18th ult. The object of the visit this year was the small but picturesque Priory of Inchmahome, situated on a wooded island in the Lake of Menteith, Perthshire, amidst beautiful mountain scenery. A party of members and friends took train from Glasgow to Port of Menteith station, where carriages were in attendance to convey the visitors to the lake. On arrival on the island the Secretary read a short descriptive sketch of the building, and exhibited a plan. The Priory, which was in the diocese of Dunblane, was founded in and evidently commenced about 1238 for monks of the Augustinian order, and is an example of the best first pointed work; it bears in plan and general details many points of resemblance to Dunblane Cathedral, which was built at the same time. The buildings have suffered much at the hand of man since the Reformation, as much of it was taken away during the seventeenth century to build a castle on a neighbouring island.

ART IN THE EIGHTEENTH CENTURY.

Mr. Humphry Ward, in the second of a course of lectures upon English Art in the eighteenth century, dealt with the life and works of Sir Joshua Reynolds. He remarked that the great debt which English Art and civilization owed to Sir Joshua was not only due to his qualities as a painter; it was due in an almost equal degree to his personality. Perhaps his greatest achievement of all was to persuade the Court, the aristocracy, and the men of letters that Art is an essential part of civilization. In two ways he showed that he was something more than a great painter. He was able to form general views about Art and to state them authoritatively and in admirable literary form; and, moreover, his strong personal charm gave him the power of becoming and remaining the friend of the most influential people of his time. Proceeding to sketch the life of Sir Joshua, the lecturer described his early years, his residence in Italy from 1749-52, his immediate and wonderful success in London, and the different stages of his subsequent career, with the gradual modifications of his style. By a series of

lantern slides he illustrated the wide scope of the painter's invention, and showed how, though he painted over 2000 portraits, he seldom repeated himself, verifying Dr. Johnson's remark, "I know no man who has passed through life with more observation than Mr. Reynolds." Then, passing to the Discourses, he spoke of Sir Joshua's views on "the grand style," and of that curious paradox, noted by Mr. Ruskin, that his own immortal successes belonged to the class which he considered the highest. He told the story of the once famous picture of "the Infant Hercules," which was sold to the Empress Catherine for the then enormous sum of 1500 guineas, and which a few years ago was found, after a long search by an enterprising English lady, without its frame, with its face to the wall, hidden in the midst of a stack of pictures in one of the garrets of the Hermitage Palace at St. Petersburg. The contrast between the fates of these "grand style" pictures of Sir Joshua, and his portraits, of which the value is rising every year, was curiously significant. The lecturer announced that the remainder of the course would be deferred till the autumn.

SOME IRISH ANTIQUITIES.

At the annual meeting of the Royal Society of Antiquaries of Ireland, Mr. Thos. Westropp read a paper on some pre-historic remains found at Carran and Kilmorney, Co. Clare. They comprised some 400 cromlechs and other remains, dozens of which were levelled to the ground, and dozens were mere featureless heaps. The barony itself had remained absolutely unchanged in the course of six centuries. Mr. James George Robertson described a silver chalice of the date 1606, which is at present in the hands of a private owner. It was in good preservation. It had the appearance of having been originally gilt. Mr. G. D. Burtchaell, assistant secretary, read a paper entitled "The Bambino of New Ross," compiled by Mr. M. J. C. Buckley. Mr. Buckley said that this "bambino" was found in the east transept of New Ross old Church. This remarkable slab evidently represented the Nativity of Christ, treated in the manner of the 13th century, to which epoch it appeared to belong, and it had all the firmness and dignity of Norman carving.

HOW MUCH PER CENT.?

The Royal Institute of British Architects has now finally affixed the stamp of its sanction to the schedule of architects' charges, with one or two amendments on the form in which it appeared in these pages three weeks ago. The usual five per cent. commission "does not include the payment for services rendered in connection with negotiations relating to site or premises." This is the revised version. Other amendments we give in italics, as follows:—"Two-and-a-half per cent. is charged upon any works originally included in the contract for tenders, but subsequently omitted in execution." "Preliminary sketches and interviews where the drawings are not further proceeded with are charged for according to the trouble involved and time expended." "The clerk of works should be appointed by the architect, his salary being paid by the client." These are the principal alterations which were arrived at at a special meeting held on Monday week, and after considerable debate, in which Messrs. E. A. Gruning, J. Douglass Mathews, H. H. Statham, John Slater, C. Forster Hayward, Edmund Woodthorpe, W. Hilton Nash, S. Flint Clarkson, Wm. Woodward, Hampden W. Pratt, A. W. Tanner, Max. Clarke, H. Hardwicke Langston, C. B. Brodie, W. H. Atkin Berry, Zeph. King and others took part. At the close of the proceedings a vote of thanks was accorded the Practice Standing Committee for their labours in the work of revision.

The Local Government Board has inquired into an application by the Newton Urban District Council for sanction to borrow £3450 for works of sewerage and sewage disposal, and £1550 for purposes of public walks and pleasure grounds.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERAVON (Wales).—For additions to the parish church, for the Rev. Henry Morris and Building Committee. Mr. G. E. Halliday, architect, 14, High-street, Cardiff. Quantities by John W. Rodgers, surveyor, 14, High-street, Cardiff:—
Evan Thomas... £2,941 J. Davies... £1,825
M. Cox... 1,976 D. Jenkins, Swansea*... 1,730
T. Watkins and Co... 1,871 *Accepted.

BERKS.—For the foundations for the proposed new buildings of the County Asylum. Mr. G. T. Hine, architect:—
R. Talbot... £4,754 A. Walters Spencer... £4,321
C. Ford... 4,494 Benfield and Loxley... 3,962
W. Hawkins... 4,400 Oxford*... 3,962
*Accepted.

FEATHERSTONE.—For the erection of a new mixed school, for the Featherstone School Board. Mr. W. Hamilton Fearnley, architect, Featherstone. Quantities by the architect:—
H. Molekin... £3,552 Milson Dixon, Ackworth*... £3,455
G. Clements... 3,534 A. Sutton†... 3,261
Jackson Bros... 3,499 F. H. Curry... 2,792
*Accepted subject to the Education Department's consent.

LONDON.—For pulling down and rebuilding the "Queen's Head" public-house, Green-lanes, N. Mr. J. Stiles, architect:—
Burman and Son... £8,600 Goodall... £8,401
Antill... 8,569 Edie... 8,367
W. Shurmer... 8,464 Edwards and Medway... 8,228

LONDON.—For alterations, &c., at the City Orthopaedic Hospital, Hatton-garden. Mr. E. Herbert, architect:—
T. Rider and Son... £3,554 Wagstaff and Son... £3,089
Colls and Son... 3,487 W. Shurmer... 3,010
J. S. Shaw... 3,865 Lidstone and Son... 2,935

LONDON.—For rebuilding house and shop in White-chapel-road. Mr. J. Hamilton, architect:—
B. E. Nightingale... £2,396 Jarvis and Son... £2,340
W. Shurmer... 2,358 J. Beale... 2,257

LONDON.—For stables, &c., at Westcott-street, S.E., for Messrs. Pink and Co. Messrs. G. Elkington and Son, architects:—
H. L. Holloway... £5,120 F. and H. F. Higgs... £4,991
W. Shurmer... 5,045 J. Carmichael... 4,940
Perry and Co... 5,043 J. Smith and Son... 4,887

LONDON.—For stables, warehouse, &c., Stepney, for Messrs. Poulter and Co. Mr. H. O. Ellis, architect:—
W. Johnson... £11,470 W. Shurmer... £9,472
J. and H. Cocks... 10,390 Perry and Co... 9,414
Harris and Wardrop... 10,219 G. Munday... 9,322
J. H. Johnson... 9,721 Kilby and Gayford... 9,236
Lawrence and Son... 9,892 Holliday and Greenwood... 9,077
Ashby and Horner... 9,789 Turnbull and Sons... 8,919
Patman and Fotheringham... 9,621

LONDON.—For erecting warehouses for Messrs. Wm. France and Co., Limited, Tooley-street. Messrs. Barnes-Williams, Ford, and Griffin, architects, Railway-approach, London Bridge, S.E.:—
G. Pott and Son... £14,185 H. J. Williams... £12,725
J. W. Falkner and Sons... 13,887 Balaam Bros... 12,682
E. Lawrence and Sons... 13,020 W. Downs... 12,630
W. H. Lascelles and Co... 12,949 W. Shepherd... 12,500
A. White and Co... 12,830 J. Smith and Sons... 12,300
Ashby and Horner... 12,775 J. Greenwood... 12,284
F. and H. F. Higgs... 12,775 *Accepted.

LONDON.—For the erection of Catholic Church, Brockley (without decorations). Mr. Young Bolton, architect. Quantities by Mr. Joseph Rookwood:—
William Downs... £2,512 Ernest A. Roome... £2,320
Jerrard and Sons... 2,480 William Romain*... 2,249
Edwards and Medway... 2,450 J. O. Richardson... 2,219
Smith and Sons... 2,423 *Accepted.

LONDON.—For house and shop at New Barnet, for the Dairy Supply Company. Mr. H. O. Lane, architect:—
Porter and Son... £1,794 Dixon and Co... £1,553
Grover and Son... 1,786 C. Butcher... 1,510
W. Shurmer... 1,771 Kiddle and Son... 1,494
McCormick and Sons... 1,699 Ellwood... 1,484
W. Waller... 1,620 Daniels... 1,469

LONDON.—For the erection of a warehouse, Blackfriars-road, S.E., for Messrs. J. Cohen and Co. Mr. C. H. Flack, architect, 9, Bedford-row, W.C.:—
Holloway Bros... £7,150 Patman & Fotheringham... £6,078
Rider and Son... 6,524 ham... 6,049
Eddie... 6,464 Wall and Co... 5,965
Fry... 6,424 Smith and Son... 5,941

LONDON.—For rebuilding bank premises, Shoreditch, for the London and South-Western Bank, Limited:—
Tennant and Co... £7,666 Yerbury... £6,750
Gough... 7,174 Hore and Sons... 6,718
Lawrence and Sons... 6,820 Carmichael... 6,170
G. Barker... 6,750

LONDON.—Accepted for the erection of houses and shops at Hither Green, S.E. Mr. Charles Young, architect, 37, Great James-street, Bedford-row, W.C.:—
George Cooper... £2,800

LONDON.—For the supply of gas engines for Lots-road pumping station, for the London County Council:—
Crossley Bros... £11,550 0 Campbell Gas Engine Co... £10,000 0
Fielding and Platt... 11,350 0
J. E. H. Andrews and Co... 10,837 14

LONDON.—For alterations and additions to the Queen's Palace of Varieties, High-street, Poplar, E., for Messrs. Maltby, Wicks, and Co. Mr. B. Crewe, architect, Savoy Mansions, Savoy. Quantities by Mr. H. E. Pollard, 5, York-buildings, Adelphi, W.C.:—
T. H. Jackson... £9,361 J. H. Johnson... £8,119
Gray, Hill, and Co... 6,530 Pattinson and Son... 7,962
Beer and Gash... 8,397 Laing... 7,821
H. Knight and Son... 8,240 Thorne... 7,375
W. Johnson and Co... 8,230 Roome... 7,127
Kirk and Randall... 8,200

LONDON.—For the erection of Wesleyan Church in Bermondsey New-road, with shops, &c., adjoining. Mr. Chas. Bell, architect. Quantities by Messrs. C. Stanges and Son:—
W. Downs... £23,583 Gold... £21,040
J. Greenwood... 53,458 J. Smith and Son... 20,090
Howell J. Williams... 23,380 J. Carmichael... 19,894
Kingerlee... 21,990 Coxhead... 19,866
Balaam... 21,543 W. Shepherd... 19,496
Rudd and Son... 21,068 J. Chessum and Son... 16,575

LONDON.—For new receiving-rooms, &c., Latimer-road, W., for Messrs. Eastman and Son. Messrs. Northcroft, Son, and Neighbour, surveyors:—
Mowlem and Co... £3,065 H. Wall and Co... £4,149
Holloway Bros... 4,780 Whitehead and Co... 4,075
Bywaters and Son... 4,486 F. T. Chinchin... 3,995
Godson and Son... 4,427

LONDON.—For erecting national schools, Warwick-road, Kensington, W. Mr. John Butler, architect:—
Dooman and Co... £6,570 F. T. Chinchin... £5,945
General Builders, Ltd. 6,400 G. and F. Kent... 5,920
Spencer, Santo, & Co. 6,184 B. E. Nightingale... 5,585

LONDON.—For alterations, additions, and fittings at the "Black Horse" beer-house, Broadway, Ilford, E., for Mr. S. Leche. Mr. Fred. A. Ashton, architect, 177, Romford-road, Stratford, E.:—

Alterations, &c. Fittings. Total.
A. E. Symes... £240... £228... £1,368
Welsh and Son... 848... 516... 1,314
W. G. Maddison... 786... 492... 1,278
J. and H. Cocks*... 778... 468... 1,246
C. Simmons... 690... 536... 1,226

*Accepted.
LONDON DERRY.—Accepted for the erection of a house, Northland-road, for Miss Scott. Mr. E. J. Toye, architect, Strand, Londonderry:—

Building.—Robert Colhoun, Strand, Derry... £1,040
Plumbing.—James McClean, Little James-street, Derry... 118

MANCHESTER.—For taking down and rebuilding "The Long Vaults," Moston, for the Openshaw Brewery Co. Messrs. C. K. and T. C. Mayor, architects, Dalton-chambers, 41, John Dalton-street, Manchester. Quantities by Mr. H. Stone, King-street, Manchester:—
Wm. Thorp... £2,850 Wm. Shaw... £2,693
F. and E. Haynes... 2,820 Geo. Macfarlane... 2,680
Young, Tinker, and R. Whithill... 2,630
Burgess and Galt... 2,698 Sons, Blackley*... 2,485

*Accepted.
NORBITON.—For additional accommodation at the Royal Cambridge Asylum, for the Trustees:—
Walter Holt and Sons, Croydon... £2,640

PLYMOUTH.—For the erection of chimney, &c., at Prince Rock. Mr. James Paton, Borough Engineer, Plymouth:—
Finch... £2,507 0 0 Dart and Pollard*... £2,370 0
Locking Joint... 2,637 14 7 ham... 2,523 0
Co... 3,888 0 0 Warner, Notting-Skinner... 2,637 14 7

*Withdrawn. *Accepted.
PORTSEA.—For the erection of St. Stephen's Church, Portsea, Portsmouth. Messrs. Mr. Reginald A. Crowley, architect, 22, High-street, Croydon. Quantities by Messrs. E. M. Whitaker and Charles G. Maylard, architects, London, E.C.:—

Amount included north aisle.
Learmouth... £9,130 0... £1,323
W. Potter... 8,706 0... 1,490

Light and Co... 7,425 0... 1,264
T. P. Hall... 6,866 10... 1,092

SOUTHAMPTON.—For conversion of No. 3, Upper Moura-place, into business premises, for Messrs. Tyrrell and Green. Mr. Wm. Burrough Hill, architect, Southampton:—
A. Wright & Son... £2,969 0 0 Udall and Co... £2,788 11 2
Jenkins and Sons... 2,964 0 0 Playfair & Toole... 2,716 0 0
H. Cawte... 2,900 0 0 H. Stevens & Co*... 2,687 0 0

[All of Southampton.]
*Accepted subject to modifications.
WINDSOR.—For building new Douglas Stores, Thames-side, Windsor, for Messrs. Neville Reid and Co. Mr. John Geo. Carey, architect, Windsor:—
Bamptide... £4,732 0 Hollis and Sons... £4,452 0
H. Reavell... 4,551 18 W. Goddard & Son*... 4,238 0
Burfoot... 4,512 15 J. Deverill†... 3,832 0

*Accepted. †Too late.

CONTRACTS OPEN.

THE METROPOLITAN ASYLUMS BOARD invite TENDERS for CERTAIN REPAIRS, &c., to CENTRAL STOVE FLUES, at the Northern Fever Hospital, Winchmore Hill, N.

A copy of the specification of the work required may be obtained at the chief Office of the Board, Norfolk House, Norfolk-street, Strand, W.C., where also drawing of the work may be inspected.

Tenders, sealed and endorsed "Tender for Repairs, &c., to Stove Flues, Northern Hospital," must be delivered at the above-mentioned office not later than TEN a.m. on FRIDAY, JULY 8th, 1898.

The Board do not bind themselves to accept the lowest or any Tender.

By order,
T. DUNCOMBE MANN,
June 27th, 1898. Clerk to the Board.

CORPORATION OF LONDON.
PUBLIC HEALTH DEPARTMENT.
TO BUILDERS AND OTHERS.

The Streets Committee of the Corporation of London will meet at the Guildhall, on TUESDAY, JULY 19th, 1898, at HALF-PAST ONE o'clock precisely, to receive TENDERS for the CONSTRUCTION of UNDERGROUND CONVENIENCES in Fenchurch-street, according to plans and specification to be seen at the office of the Engineer to the Corporation, at the Guildhall.

Tenders are to be on the forms supplied at the said office, to be sealed, endorsed "Tender for Underground Conveniences," addressed Town Clerk, Public Health Department, Guildhall, and delivered before HALF-PAST ONE o'clock on the above-mentioned day.

Persons sending in proposals must attend themselves (or by duly authorised agents) at HALF-PAST ONE o'clock, on the said day.

Security will be required for the due performance of the contract.

The Committee do not pledge themselves to accept the lowest or any Tender.
Guildhall, June, 1898. MONCKTON.

The R. A. Show.

IT is not the exhibition at Burlington House, but the Royal Agricultural Show at Birmingham, to which our heading refers. For an agricultural show, the building trades' interest has crept very prominently to the front, and on every hand are exhibits which claim the attention of those who have to do with bricks and mortar equally with those whose interest is in ploughshares and corn-fields. To some of these specialities we referred in our last issue; to others we must refer this week:—

MESSRS. OATES AND GREEN, HALIFAX.

A stand of brown ware in an open space, with goods that are familiar enough to all frequenters of "Health" or "Building" exhibitions, is occupied by Messrs. Oates and Green. Their speciality at the "Royal" is brown salt glazed sanitary mangers, which they already supply to all the principal railway companies. There is also to be seen here an excellent lavatory basin, which is an article that, so far, has not been the object of much attention for this firm, but which they can evidently produce as well as anybody.

MR. ANDREW POTTER, WOLVERHAMPTON.

Ropes, twines, tarpaulins, roofing, felt, and tent goods fill a big stand taken by Mr. Potter, whose business, it may be noted, has developed of late to such a degree that new premises in Wolverhampton are being built to take the place of the old and scarcely convenient ones in which his goods have been displayed for many years.

THE BLACKMAN VENTILATING COMPANY LIMITED.

The well-known fans of this Company are in operation at a stand that received careful attention from the visitors. The drying of malt and various other processes in which rapid circulation of air is required were thoroughly explained from the Company's point of view by their representative, and the attention given by agriculturists to the application of the fans to the drying of chaff, &c., doubtless resulted in good business.

MESSRS. WORRALL AND COMPANY, LIVERPOOL.

This firm showed, among other exhibits, a patent collapsible iron gate, and a variety of art metal work. The neat circular given away at this firm's stand merits a word of compliment. It was remarkably effective, and to the point.

THE EXPANDED METAL COMPANY.

The employment of expanded metal in the construction of fireproof buildings was shown at a large stand in the implement yard, and also the use of the metal for such specially agricultural or rather rural work as tree guards and fences was illustrated by a well-selected exhibit.

MESSRS. RICHARDSON AND CO., DARLINGTON.

A large conservatory shown by this firm was a very welcome shelter from some of the showers that were by no means infrequent during the greater part of the Show. The traveller by the East Coast route to Scotland will know the Darlington sign of the firm well, standing out as it does so prominently just at the south end of the station on his right going north; but the Show Stand was even more prominent, if possible, by reason of a big sky-sign opposite the Horse Ring, in a singularly effective position. The conservatory contained specimens of the firm's heating apparatus, as well as being in itself illustrative of the main part of the Darlington business.

MESSRS. R. J. HARRIS AND SON, RUGELEY.

Garden seats were the main feature of this firm's stand, and one very neat and comfortable specimen at a pound took the public fancy considerably. There were also other

specimens at various rates of cost, and evidently Messrs. Harris are to be reckoned with in this department of ironwork.

MESSRS. THOMAS BRADFORD AND CO., MANCHESTER.

The churns and other dairy implements in use at the Show are for the most part the manufacture of this firm, but there are other specialities as well as dairy machinery. In the laundry the firm is undoubtedly *facile princeps*, and the Show is not without evidence of this fact. The handbook given away at the stand is full of illustrations of every sort of washing gear and drying apparatus, and hotel proprietors will be interested in a mechanical boot-cleaner, which has hitherto seemed to be the unattainable in machinery. Machines for the cleaning of boots are legion, but the successful polishing of the boot is quite another affair, and it is to be hoped that this of Messrs. Bradford will be found to accomplish the desired object.

AN ENGINEERING EXCURSION.

A VISIT TO THE GREAT WHEEL.

AN extremely interesting visit was made by a party of the members of the Society of Engineers a few days ago to the works of the Gas Light and Coke Company at Fulham, and the Gigantic Wheel at the Earl's Court Exhibition. Among those present were:—Mr. W. Worby Beaumont, president; Mr. H. Adams, past president; Messrs. J. Patten Barber, J. Bernays, G. Burt, D. B. Butler, Percy Griffith, R. St. George Moore, M. Wilson, Members of Council; and Mr. G. A. Pryce Cuxson, secretary.

DESCRIPTION OF THE GAS WORKS.

The coal received, amounting to 130,000 tons per year, is unloaded by Hone's patent single chain grabs (capacity 1 ton, each lifting 45 tons per hour), and deposited into bunkers, from which it is distributed to the several retort houses by small wagons. When storing coal in the open it falls down shoots from the bunkers into a conveyor of the push plate pattern, and is carried along to the storage ground, where it is dropped from a shoot at the end of the conveyor into small wagons, which are run and tipped so as to form a heap of an average depth of 10ft. to 12ft. The total coal storage is 30,000 tons—14,000 in retort houses and 16,000 in the open. The retort houses, of which there are six, have a capacity of 9,000,000 cubic feet per 24 hours. They contain 760 retorts 20ft. long, and are heated by generator furnaces, which require about 20 per cent. of the total make of coke for fuel, leaving 80 per cent. for sale. The

HEAT OF THE RETORTS

is about 2100 degrees Fahrenheit, and on the average 10,000 cubic feet of gas are distilled from one ton of coal, each retort producing about 12,000 cubic feet of gas per twenty-four hours. The exhausters—rotary pumps—are used for the purpose of exhausting the gas from the retorts, and forcing it through the purifiers and other apparatus into the gas-holders. The condensers—stacks of pipes through which the gas flows up and down—are for the purpose of reducing the temperature to about that of the atmosphere, and of removing from the gas all tarry or solid particles. The scrubbers—tall towers in which are placed beds of tightly packed coke or boards on grids, and down which ammoniacal liquor or water is sprayed—are for the removal of the ammonia from the gas, which travels in an opposite direction to the water. A considerable proportion of sulphuretted hydrogen and carbonic acid is also removed in the scrubbers. The purifiers are rectangular boxes, with lids sealed by water lutes, in which are placed the purifying materials in layers, usually six, and of a depth of about 4in. The impurities in the gas when it arrives at the purifiers are carbonic acid, sulphur existing as carbon bisulphide, and sulphuretted hydrogen, which are eliminated by slaked lime, oxide of iron, and weldon mud,

the last two materials, however, being only used for the extraction of the sulphuretted hydrogen. The gas, after leaving the purifiers, passes through the station meters, where it is registered, and thence into the gasholders.

DESCRIPTION OF THE GIGANTIC WHEEL.

The Great Wheel at Earl's Court, although entirely of English manufacture, is more or less an American innovation. Mr. W. B. Basset prepared the drawings, with the aid of Mr. J. Webster, Mem.Inst.C.E., Consulting Engineer to the Company. The Gigantic Wheel and Recreation Towers Company was formed, and in March, 1894, the work commenced. The foundations consist of eight solid cubes of concrete, each weighing over 250 tons, with steel bolts 16ft. long bedded into them, and to which are attached the bases of the eight columns. These columns are each 4ft. square, built of steel plates with internal diaphragms. The first and second lengths of these columns were hoisted into place by a 96ft. pair of sheer legs. To erect the upper lengths of the columns, a wooden stage was built across the gap through which the wheel now revolves, and on it two Scotch cranes were set up, one to work on each side. About the middle of July the columns were completed, and the great axle, built of lin. steel plates and 9in. steel girders bent into circular form, was brought from Messrs. Maudslay's works at East Greenwich to Earl's Court.

TO HOIST IT INTO PLACE

The wooden bridge was used, with a strong trolley fitted on it to run on rails. With tackles hung from this trolley, the bearings, weighing 11 tons each, and the axle, weighing 57 tons, were hoisted. The first quadrant of ten spokes was built in the following manner. A spoke was hung from the axle, the length being carefully adjusted to gauge, and the portions of the periphery, or outer ring, were attached. Two powerful tackles, capable of exerting together a pull of 120 tons, were fixed to an anchor-post, and towards this anchor the spoke was hauled out of the way when finished. Another spoke was then hung in its place, and connected to its periphery girders, and in this manner the ten were hung and adjusted until the quadrant was held so that the last spoke erected was vertical, when the steam-winch actuating the tackle could pull no more. The second quadrant was built from a scaffold 150ft. high, the first and second quadrants balanced each other, and all the strain was thus removed from the anchor. For the third quadrant, a strut, which weighed alone over 60 tons, was securely fixed in the first quadrant, the tackles were again brought into play. The fourth quadrant was erected by building the inner periphery girder, by aid of a hanging scaffold, to bridge the distance between the first and third quadrants, and from it the outer periphery and spokes were erected. The last two bolts in the outer peripheries were driven by Mrs. Walter Basset at a height of 280ft. on April 26th.

SINCE THE COMPLETION

of the Earl's Court Wheel, Mr. Basset has, with the help of his two assistants, Messrs. C. F. Hitchens and H. C. Booth, Assoc. Mem. Inst. C.E., designed and erected a gigantic wheel at Blackpool, and another at Vienna, and is now engaged on the erection of one in Paris larger even than the Earl's Court Wheel. A comparison between the methods adopted both in the design and erection show the result of experience, combined with careful study. The weight of steel used in the Earl's Court Wheel, amounting to 1200 tons, has been reduced in the Paris Wheel to 783 tons, although the Paris Wheel is the greater, without in any way jeopardising the safety of the public. The axle, instead of being of boiler plates 7ft. in diameter, is a solid forging, 26in. in diameter, weighing 32 tons. The cars are hung on cantilevers, instead of between the periphery girders, giving a lighter and more graceful appearance. The erection is effected by means of two Scotch steam cranes with jibs 100ft. long, on stages 250ft. high. These are believed to be the highest crane stages ever used.

Builders' Notes.

THE Great Northern Railway announces the opening of the first portion of its new Deansgate goods depôt in the City of Manchester. The depôt occupies a most central and commanding site in the heart of the city facing Deansgate, and adjoins the central passenger station of the Cheshire Lines Committee, of which the Great Northern are also joint owners. Pending the completion of the warehouses now in course of erection, convenient warehouse accommodation will be provided in proximity to the new depôt.

THE Waterloo and City Railway will be formally opened next Monday. Sir Francis Marindin has already made an unofficial inspection of the permanent way, and at his suggestion the treads of the new staircases giving access to the City Station—one at the angle of the premises of Messrs. Mappin and Webb, in the Poultry, the other in Walbrook, fronting the Mansion House—have been increased in width so as to comply with the Board of Trade requirements. These staircases will afford ingress and egress to the City Station pending the approaching completion of the public subway below the crowded crossing at the Mansion House, the Bank of England, and the Royal Exchange, and as soon as the subway is ready for use a third means of approach to the new railway will be provided. It is hoped that the line will be available for traffic on the day following the opening ceremony.

MR. JUSTICE KEKEWICH in the Chancery Division last Wednesday heard the case of The Christian Herald Company Limited v. The Co-operative Printing Society Limited, an action by the plaintiffs for an injunction to restrain the defendants from continuing the erection of a building which it was alleged interfered with the access of light to their premises in Tudor Street, City. The plaintiffs' case was that the site of the defendants' present building was formerly vacant land, having upon it a boundary wall about 12ft. high. The defendants' building was 56ft. high. The plaintiffs said that they did not object to the defendants' building being erected to a height of 30ft., but they asked for a mandatory injunction compelling the defendants to reduce their building to that height. The main defence was a denial that there had been any diminution of the plaintiffs' light, and an assertion that the plaintiffs had not suffered damage by the action of the defendants.—The judge, who went and viewed the place, said that he had no alternative but to grant a mandatory injunction calling upon the defendants to reduce the height of their building to 30ft., the work to be accomplished by the 31st of October. If the parties did not come to terms the question of any damages would be referred to the Official Referee, who would inspect the premises. The defendants must pay the costs of the action.

THE opening of the new line of railway between North Walsham and Mundesley-on-Sea marks the beginning of a series of railway extensions which will be carried out by a joint committee of the Great Eastern, the Great Northern, and the Midland Railway Companies. The line from North Walsham forms a junction with the Great Eastern Company's Norwich and Cromer line and the Midland and Great Northern joint committee's Lynn and Yarmouth line, and extends a distance of 5½ miles to Mundesley-on-Sea. The line will be a single one, with only one intermediate station, to be known as Paston and Knapton. The second section, yet to be constructed, will be a new line between Mundesley and Cromer, a distance of eight miles along the coast, and passing *en route* Trimmingham, Sidestrand, and Overstrand, each of which villages will be supplied with a railway station. The third section will proceed in the opposite direction from Mundesley to Happisburgh, or Hazeboro, serving also the villages of Bacton and Walcott. A further important section of the

same scheme is a new direct line, ten miles in length, between Lowestoft and Yarmouth, which will also serve the intermediate villages of Gorleston, Hopton, and Corton. In this way no fewer than ten sea-side resorts will be made more accessible, while opportunities will be offered for the creation of others, and greater facilities given for communication between the towns of Yarmouth and Lowestoft. According to the train service which has been arranged, Mundesley, the terminus of the first section, will be about three hours from London.

FOR some weeks past the Bristol Master Builders' Association have been considering a demand made by the employes in various branches of the building trades for an advance of wages and alteration of the working rules. Meetings have been held and negotiations have also been conducted by correspondence, until so far as the federated trades are concerned the points in dispute have been narrowed to two—viz., the date at which the advance shall come into operation, and the rule with reference to "walking time." The last communication from the federated trades, dated June 28, contained a suggestion to refer the two points to arbitration. A meeting of the Master Builders' Association was held last week, and the result was that a letter was addressed to the Federated Trades by the secretary (Mr. H. J. Spear) containing the following: "As there does not appear to be any possibility of arranging the two points at variance between this association and the federated trades, I am desired to inform you that the members of this association are prepared to act upon your suggestion to refer those points to arbitration, and that such arbitration shall be through the medium of the Board of Trade under the provisions of the Conciliation Act of 1896." A copy of the letter has been sent to the Bricklayers' Society and to Mr. J. Curle, secretary of the Bristol Trades Council. We are also informed that all the federated trades, with the exception of the masons, have communicated with the Master Builders' Association, to the effect that they will agree to the points being submitted to arbitration, and that they will continue work until the award of the Board of Trade arbitrator is given.

MR. JOHN CROWLE, owner of the De Vere Hotel, Kensington Road, was summoned on Friday week, at the West London Police Court, by the London County Council, for having erected a structure beyond the general line of buildings of Kensington Road. Mr. Chilvers, from the Solicitor's Department, represented the Council, and stated the structure complained of was a covered way 12ft. high and 8ft. wide, erected at the entrance to the De Vere Hotel, which defendant erected after the Council had intimated that they objected to it. Section 22 of the London Building Act, 1894, provides that no structure should be erected beyond the general line of buildings without the Council's consent, and Mr. Chilvers referred to the fact that these premises had formed the subject of considerable legal proceedings some years ago in the case of Burlow and the Vestry of Kensington, which went from that Court to the House of Lords.—Mr. Bellevue, for the defence, contended that the covered way was a mere hood and not a structure within the meaning of the section under which the summons was issued, also that the certificate was bad, as the architect had drawn several lines and not a line of buildings, and he further contended that the magistrate could not convict his client, as no order had been made in accordance with Section 200, Sub-section 33, which was necessary before a conviction be obtained or any penalty imposed.—The magistrate, Mr. Rose, in giving his decision, stated the covered way was certainly an improvement to the hoarding which originally existed, but he was of opinion that it was a structure which required the consent of the Council for its erection, and that he had power to impose a penalty, and he should fine the defendant 10s and order him to pay £1 3s. for costs.

Surveying and Sanitary Notes.

THE Grange-over-Sands Urban Council has adopted plans, and is making application to the Local Government Board for powers to borrow £10,000 to carry out certain improvements which have been under consideration for three and a half years. It is proposed that the sewage which now drains upon the foreshore at various points shall be collected and carried beyond the town along the railway embankment, outside which will be erected a promenade. The new sea wall will reclaim five and three-quarter acres of land, which will probably be used as a recreation ground.

THE Sanitary Committee of Stoke Newington have played their ratepayers a practical joke. Having to re-arrange a part of the drainage system, these merry wags lately erected a ventilator in one of the streets, but before the drains had been interfered with at all. They then awaited results. In a day or two's time letters came pouring in complaining of the most objectionable effluvium which issued from the ventilator, and when the storm was at its full height the joke was explained. The ratepayers were still indignant, however; they had smelt a rat before, but they draw the line at smelling an effluvium.

THE Corporation of London is said to have been unfortunate in its attempt to oust the New River Company from the supply of certain artisans' dwellings in Houndsditch. The Corporation sank a well, at a cost of some £8000, and the current expenses of the supply are about £180 a year. The Company offered to do the whole thing for about £80 a year, with, of course, no outlay of capital on the part of the Corporation. It is therefore a serious loss all round. Wide and sweeping conclusions will probably be drawn from the isolated fact, but they may easily be erroneous. The city had to create a plant; the Company, no doubt, had its plant on the ground. The annual cost of the Corporation service would probably supply a much larger area at but a slight increase. If the Corporation has paid too much in this instance, the companies unquestionably charge too much at all times.

THE Recorder, Sir Charles Hall, Q.C., M.P., and a special jury sat at the Guildhall last Wednesday to hear the case of "The Trustees of the London Parochial Charities v. the Corporation of the City of London," a claim for compensation in respect of the freehold interest in premises known as No. 4a, Cheapside, which are required for the purposes of the widening of the west end of Cheapside. Mr. Edward Boyle, Q.C., and Mr. Reginald Neville appeared for the claimants; Sir William Marriott, Q.C., and Mr. Rose-Innes represented the Corporation. The property in question was let at a ground rent of £40 per annum for sixteen years from Midsummer, 1898, and it was agreed, during the hearing, to be taken on the 3 per cent. tables, £500. It was admitted that the property would be worth about £500 per annum at the expiration of the existing lease in 1914, and the question for the jury was the proper basis upon which to capitalise that reversionary value. For the claimants it was contended by Mr. Daniel Watney (past president of the Surveyors' Institution) and Mr. G. A. Wilkinson that the sum of £500 per annum receivable after the year 1914 should be valued on the 4 per cent. tables (13½ years' purchase), or £6700, which, with the customary addition of 10 per cent. for compulsory sale, brought the claim to a total of £7924.—On behalf of the Corporation Mr. Robert Vigers (president of the Surveyors' Institution) and Mr. Alexander Rose Stenning gave evidence to the effect that the reversionary rental of £500 in 1914 should be capitalised on the 5 per cent. tables (9½ years' purchase), £4255, showing a total of £5626, including the usual 10 per cent.—The jury awarded the claimants the sum of £6850.

DESIGN & DETAIL OF DOMESTIC BUILDING.

III.—A HALF-TIMBERED HOUSE.

By JOHN E. NEWBERRY, A.R.I.B.A.

TO avoid unnecessary recapitulation, I must refer my readers to the first article of this series, which treats of a cottage in red brick and tile. The principles therein laid down will equally apply for a half-timbered house, the subject that is now under consideration. Especially I would refer to my

KEY ELEVATION

notes on roofs, height of rooms, and details of windows and glazing.

Successful design in what is so essentially a mediæval manner is only to be attained by careful study of old work. Actual measurement of good ancient examples will teach more than can possibly be taught by writing, and the student should not only record the dimensions and examine the construction, but also endeavour to analyse the reasons and methods of the designer. Much of the charm of old half-timber work is owing to the effects of time, the picturesque irregularity of the composition, and to the solidity and texture of the timber framing. Any attempt at imitation is bound to fail, and if we cannot use good honest timber, and plenty of it, we had better adopt some cheaper form of construction. Failures in design are most frequently owing to want of width in the timbering, and too great a space being left between the timbers.

MATERIALS.—English oak is undoubtedly the best material for external timbering—it should be left roughly planed with a jack-plane and on no account oiled or varnished, but just allowed to bleach as most of the old work has done. Well-seasoned fir timber is a good substitute for oak, and may be treated with two coats of Stockholm tar to preserve it. A roof covering of slates, preferably of the green variety from Westmoreland, looks charming and is most durable, but tiles are more usual in the South of England. It would appear almost unnecessary to advise against the use of slates and tiles in the same building. The writer saw this combination used a few days ago on a church, the nave roof being tiled and the aisle roofs slated. The effect was by no means happy.

Three methods of half-timber construction are shown on the details.

TIMBER AND PLASTER.—The practical difficulty in modern half-timber work is to keep your house thoroughly dry, warm, and weather-tight. I do not think this can be effected without three separate layers of plaster between the timbers. Two methods of construction are shown, which I will refer to as the solid method and the modern method. In the latter system the greater part

of the upright and diagonal pieces are only 2½ in. thick, with 2 in. by 2½ in. fillets nailed to them to take the inside plastering. All angle and window posts, heads, and sills are 5 in. thick, as shown on the section of oriel window. Fillets, 1 in. by 1½ in. square, are nailed to the sides of uprights to take plaster laths, and similar fillets are nailed at the top of all horizontal and diagonal timbers. The timbers are grooved all round for plaster on the external face, excepting the tops of horizontal and diagonal pieces, which are rebated only for plaster, thus allowing moisture to escape instead of soaking into the groove.

OAK PINS.—Whether the timber framing is constructed of oak or fir, it must be pinned together with oak pins. These may either project an inch, or else be roughly cut off flush with a hand-saw. They may be ¾ in. to 1 in. in diameter.

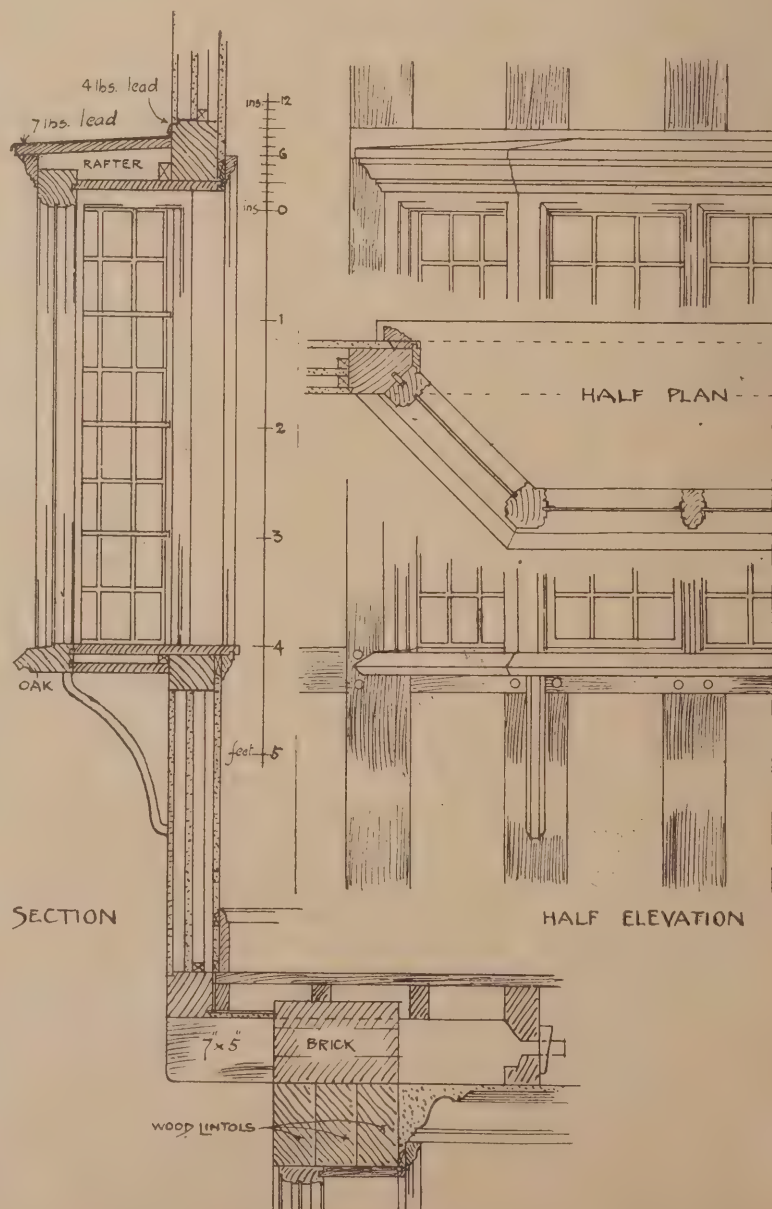

PLASTERING.—The middle layer of plastering is finished before the outer face is commenced, and consists of lathing and two coats of plaster. A good method of finishing the external face between the timbers is to coat the laths with a mixture of plaster and Portland cement, mixed in equal proportions, and at least ¾ in. thick: this should be well squeezed into the grooves of timbers and finished with a coat of rough-cast composed of lime and coarse sand and gravel, which will give a rich creamy tint. The last coat must be finished flush with the timbers.

TIMBER AND BRICK.—Where half brick filling-in is used, I would insist on oak being employed for the timbering. A plan and section of such a method of construction is shown. The porous nature of red bricks renders it

probable that driving rain would penetrate through the half brick wall; in order to get rid of any moisture that may come in, the vertical timbers are throated and the tops of all horizontal pieces are covered with a lead flashing turned up over fillet and copper nailed. Thin red bricks, 2 in. in thickness, are most suitable for filling-in, and should be rendered on the inside. The backs of timbers are shown to be battened for plastering and intermediate upright fillets are intended to be fixed against brickwork where required, not less than 14 in. apart, to carry the plaster laths. Many fanciful patterns for arranging the brick filling-in may be found in old work, such as diagonal, herring-bone wise, or chess-board fashion.

WINDOWS.—Casement windows I consider a necessity in half-timber work. They should consist of moulded wood mullions with a simple form of iron casement and frame hung in some of the lights. They would naturally be filled with quarry glazing. The external face of the window frame should be kept back ½ in. from the face of timber work, as already described for wood windows in brickwork. The post should be rebated to receive window frame, and sill pieces may be cut out for window-sills in order to avoid breaking the horizontal line.

A projecting window is shown on the key elevation, and in detail elsewhere. Two or three of the lights are intended to have iron casements fixed in them. The timber framing overhangs some 12 in. in front of the lower brick wall, and is carried on 7 in. by 5 in. joists, which are tusk-tenoned into a trimming-joist. The upper part should be well bolted back to brickwork. Care must be taken to render the

PLAN

SECTION

plastersoffit between joists thoroughly draught-proof. These overhanging upper stories are delightful features in old examples, and many are the suggestions that may be obtained from them.

BARGE-BOARDS are generally not less than 2in. thick, and, if of deal, should be plain and moulded only on the lower edge. A moulded fillet, some 3in. by 2in., is required to hide the ends of the tile laths and fit close under the single course of flat tiles mentioned in article No. I. A barge-board, such as is shown on the key elevation, might project 10in. from the face of timber and should be carried by short purlins 4in. by 3in., supported by shaped brackets. The soffit might show the laths and tiles or slates, as described for the eaves in article No. I. Ornamental barge-boards are very difficult to design, and are features that often run to seed on speculating builders' villas. The modern architect, with such examples before him, does well to keep them plain moulded only. There are, however, many old and beautiful examples of elaborately carved oak barge-boards scattered about the country, which show how they may be properly treated.

EXTERNAL PAINTING should be confined to joiners' work, as distinguished from that of the carpenter. In a half-timber and plaster house with tiled roof I would paint windows, barge-boards, etc., green, always supposing them not to be oak. Fir timber framing, as previously mentioned, should have two coats of Stockholm tar applied to it, which will produce a rich brown colour. A stone and slate house with tarred timbers might have the joiners' work finished in some shade of red.

(To be continued.)

THE new inclined retort houses at Meadow Lane Gasworks, Leeds, will be ready for opening at the end of next month.

WE are compelled, through space considerations, to withhold the concluding half of Mr. George T. Brown's paper on "Building Stones and Quarries of Northumberland and Durham." It will appear in our next issue.

THE excavations for the underground lavatory, which the Birmingham Public Works Committee intend to construct in that part of High Street commonly known as the Bull Ring, is being commenced. Similar operations have been commenced in the Old Square.

Trade and Craft.

THE FARNLEY IRON COMPANY.

Exceptionally neat in design is the "Catalogue of Glazed Bricks, Porcelain Baths, and other Glazed and Sanitary Goods made at Leeds from Farnley Fire-Clay," a copy of which has been sent to us by the Farnley Iron Company. No less than twenty-seven separate items are to be found in the table of contents, and although in the very nature of things some of the products of the works are not in any special sense artistic to look upon, the manner in which they are here set forth leaves nothing to be desired, while those that are really in themselves picturesque receive the fullest justice. It is, we learn from the introduction of the book, some fifty-four years since the works were first opened for the purpose of working the minerals found in the estate of about two thousand acres, and, whether it be in coal, or iron, or clay (with which we are here chiefly concerned), it must be admitted that the works have amply justified themselves in the years that have passed since the opening. The first pages of the catalogue are devoted to the famous Farnley glazed bricks, made from the Farnley clay, which is peculiarly fitted for the manufacture of these goods, as while it allows the production of an enamelled surface impervious to the weather, it at the same time gives a hard building brick, with a high resistance to crushing strain. For the subway work that has become so great a feature in the large towns of this country, these bricks are singularly suitable, and preferable to tiles, which, while good externally, are less strong structurally. The Farnley Iron Company are exporters as well as manufacturers, and their glazed bricks are known in many a town far enough from the British Isles. In white, and also in various colours,

the bricks are adaptable to every variety of work, and a coloured page is full of suggestion for the artistic use of this material. About a dozen pages are devoted to the illustration of designs for shaped and moulded bricks, and then the catalogue passes to the porcelain baths, referring on the way to the facing tiles salt-glazed bricks. We quote from the book upon the use of this material for baths as follows:—"Besides the capacity for holding hot and cold water, a bath should have a surface smooth and pleasant to the touch, impervious to acids and alkalis, and that can easily be kept clean. Such qualities are, for instance, found in toilet basins of earthenware or china; basins made of wood, tin, copper, or enamelled iron being only used where cheapness is an important consideration. Such inferior material; were used for baths only, because the latter are too large to be made of earthenware or china; and as the enamel on iron baths generally breaks off and exposes a rusty metal underneath. When fireclay, as treated at Farnley, was found strong enough to endure all the processes of manufacture, including the intense heat of the kiln, iron and other materials at once became obsolete for the best work. Even baths carved out of solid marble and polished are found to become greasy when exposed to the action of soapy water. The superiority of the fireclay baths, with their porcelain surface, is confirmed by the experience of chemical manufacturers who use them for the storage of acids and other corrosive liquids, which would destroy any of the materials of which baths were formerly made." Several pages of illustrations show the Farnley baths and other sanitary ware in every variety of pattern. A reference to the Company's iron completes one of the most useful trade catalogues we have seen for many a day. The London showrooms for these goods are at 77, Queen Victoria Street, E.C.

PROPERTY & LAND SALES.

HAMPTON and SONS beg to announce that their AUCTIONS of LANDED ESTATES, town and country Residences, Investments, Business Premises, and other Properties, are held MONTHLY at the MART, Tokenhouse-yard, E.C.

Auctions can also be held on other days, in town or country, by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.

June List of Estates, town and country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to Hampton and Sons (Ltd.), 1, Cockspur-street, S.W., or by post, three stamps.

Auction and Estate Offices, 1, Cockspur-street, Pall Mall, S.W.

FINCHLEY ROAD.

Occupying a pleasant position in this favourite residential locality, close to Marlborough-road Station, with frequent service of trains to the City and West End, and within a short drive of Regent-street.

The conveniently placed, double fronted, detached Family Residence and Stabling, known as Bishop's Lodge, 35, Finchley-road, N.W., substantially built, and standing well back from the road, approached by a carriage-sweep. Held for 39 years unexpired from Michaelmas next, at a ground rent of £20 per annum. Possession on completion of the purchase.

Also the Two well-placed and attractive, semi-detached Houses, Nos. 5 and 15, Finchley-road, N.W., each containing six bed rooms, bath room, three reception rooms, conservatory, and usual domestic offices. No. 5, Finchley-road, is let upon a five years' lease from September, 1897, at £90 per annum, thus forming a good investment. Both held on lease, having an unexpired term of about 23 years, at a ground rent of £11 per annum each. Vacant possession of No. 15 on completion of purchase.

HAMPTON and SONS will SELL the above by AUCTION, at the Mart, E.C., on WEDNESDAY, JULY 13, 1898, at 2 o'clock, in three lots (unless previously disposed of by private treaty). Detailed particulars and conditions of sale can be had of Messrs. Foss and Ledsam, Solicitors, 5, Fenchurch-street, E.C.; and of the AUCTIONEERS, 1, Cockspur-street, S.W.

Close to railway stations on L. and N.W. Midland, Met., and N.L.; also bus routes to City and West-end.

MR. LEOPOLD FARMER will SELL by AUCTION, at the Mart, E.C., on WEDNESDAY, JULY 27th, 1898, at 2 o'clock, the following: WEST HAMPSTEAD.—With possession.—3, Sherif-road, Westend-lane.—Freehold detached Residence, having five bed and dressing rooms, bath, two reception rooms, conservatory, usual offices. No basement.—Solicitors, Messrs. Futvey, Field, and Baker, 23, John-street, W.C.

ST. JOHN'S WOOD.—With possession.—117, Alexandra-road.—Long Leasehold Residence, having six bed and dressing rooms, bath, three reception rooms, usual offices. Good garden.—Solicitors, Messrs. Yeo and Co., 41, Finsbury-pavement, E.C.

Particulars and conditions of sale at the Mart, E.C.; the respective SOLICITORS; and the AUCTIONEER, 46, Gresham-street, E.C., and Kilburn, N.W.

Little Iford, within a few minutes from East Ham, Iford, and Manor Park Stations.—Fourth Auction Sale.

THE PREMIER LAND COMPANY (Limited) having sold every lot at their previous auction sales, will SELL by AUCTION, at the PUBLIC HALL, Plashet-grove, East Ham, on WEDNESDAY, JULY 20th, 1898, at 7.30 in the evening precisely, 120 valuable FREEHOLD PLOTS, including frontages to Rectory-road and Elsenham-road, also valuable shop plots in Church-road. No tithe or land tax. Payment by instalments, spread over 4½ years, if desired. Possession on payment of deposit. Free conveyances. The new roads are formed and kerbed, and have separate sewers and surface water drains.—Particulars, with plan and conditions of sale, may be obtained, when ready, at the place of sale; the principal hotels in the neighbourhood; of the PREMIER LAND COMPANY (LIMITED), 10, New Broad-street, E.C.; Messrs. TAYLOR and TAYLOR, Solicitors, 10, New Broad-street, E.C.; or of Mr. H. A. RAWLINS, Surveyor, 45, Queen Victoria-street, E.C.

HILL PARK ESTATE, Westerham, Kent, twenty miles from London, 500ft. to 700ft. above sea level.—FREEHOLD choice BUILDING SITES for SALE on this rising, high-class residential estate, from one acre and upwards. Chalk subsoil; magnificent views. Also excellent, well-built Residences to be sold or let. Rents from £50 to £250 a year. Water supplied by the West Kent Water Company. Fast through trains to and from City daily.—Apply to the RESIDENT AGENT, on the Estate.

TO BUILDERS.

The Freeholder of a large suburban Estate (S.W.) wishes to meet with ONE or TWO BUILDERS accustomed to building good-class suburban property of from £60 to £120 a year rental. Main road, prettily wooded sites for houses. Plenty of ground to each plot, several having tennis lawns; main drainage; cricket and tennis clubs and three golf courses within a mile. Eight miles from Royal Exchange. Some shop plots adjoining railway station on main road. The land will be sold or let with restrictions, and advances can be had. Unquestionably one of the best things going at the present time for the right man.

Freeholder's Surveyors and Architects, Messrs. CHESTERTON and SONS, 51, Cheapside, E.C.

Lambeth.—Valuable Ground Rent, with Reversion in 1916.

MESSRS. ARBER, RUTTER, and WAGHORN will offer for SALE, at the MART, Tokenhouse-yard, City, on WEDNESDAY, JULY 20th, at One o'clock precisely, a well-secured COPYHOLD GROUND RENT of £20 10s. per annum, arising out of

the five messuages, Nos. 90, 92, 94, 96, and 98, Vauxhall-walk, with reversion at Christmas, 1916, to the rack rents, estimated at £175 per annum.

Particulars of sale of Messrs. WERN, NICHOLS, and Co., Solicitors, 11, Argyll-street, W., and of the AUCTIONEERS, 1, Mount-street, W.

Unusual opportunity of acquiring a high-class Marine Freehold Residence at Bognor-on-Sea.—Purchasers need only pay a deposit of 10 per cent., the balance by half-yearly instalments extending over nine years.—The imposing House, No. 2, Park-terrace, in an exceedingly pleasant position on the esplanade, facing these. It contains eight airy bedrooms, four spacious reception rooms, and ample domestic offices. Suitable for a high-class boarding house. Also Freehold Houses, 3 and 4, Lansdown-place; let at £65 and £70.

MR. GEORGE F. HARRINGTON will SELL the above by AUCTION, at the MART, London, E.C., on JULY 26th, at TWO, in three lots.

Particulars of W. J. MYATT, Esq., Solicitor, 23, Abchurch-lane; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

By order of the Trustees of the late Robert James Chaplin, Esq.—Catford.—To Builders and others.—10a. Or, 18p. of Freehold Land, situate in a first-class position, with possession at Christmas next, when part will be available for building, having existing frontages; also a Freehold Ground Rent of £30 a year, secured on residences, in the same neighbourhood, which will be sold by Auction by

MR. GEORGE F. HARRINGTON, at the MART, E.C., on JULY 26th, at TWO, in two lots.

Particulars of Messrs. BADHAM and WILLIAMS, Solicitors, 3, Salters' Hall-court, E.C.; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

MESSRS. GREEN and SON, AUCTIONEERS and SURVEYORS,

28 and 29, St. Swithin's-lane, London, Beg to announce that their SALES by AUCTION of FREEHOLD, LEASEHOLD, and COPYHOLD PROPERTIES, Ground Rents, Life Policies, and Reversions take place at the MART on the LAST FRIDAY in the MONTH, and on such other occasions as may be arranged.—Particulars are invited 21 days prior.

MESSRS. GREEN and SON undertake SURVEYS and VALUATIONS of LAND and HOUSE PROPERTIES, as well as Machinery and Plant, for

Ratings, Compensations, Partnerships, Assessment Appeals, Estate Duties, Dilapidations, Fire Losses, Mortgages, and other purposes. Estates managed and rents collected under Receivership and other powers.

Radlett, Herts.—Fifteen miles from London and five from St. Albans.

MR. F. G. WHEATLEY (in conjunction with Mr. W. F. INGRAM) has received instructions to OFFER for SALE by AUCTION, on THURSDAY NEXT, JULY 7th, 1898, in a MARQUEE on the ESTATE, at 1.30 p.m., 58 PLOTS of FREEHOLD BUILDING LAND, suitable for the erection of all classes of houses. The estate adjoins Radlett Station, on the Midland Railway, and is surrounded by beautifully-wooded country. Land tax and tithe free. Good roads. Water mains on the estate. Sewers laid. Payments by instalments (if desired). Deeds free of law costs. The sale will be preceded by a luncheon at One p.m.

Particulars, plans, and conditions of sale may be obtained of E. C. PHILLIMORE, Esq., Cobden-hill, Radlett; Messrs. BURGOYNES, MILNES, and GREATERBACH, Solicitors, 356, Oxford-street, W.; Mr. W. F. INGRAM, 2, St. Andrew's-place, Lewes, Sussex; or of the AUCTIONEER, 263, Strand, London, W.C.

FREEHOLD BUILDING LAND.—TO BE SOLD, a valuable BUILDING SITE with extensive frontage to Lordship-lane, East Dulwich, and having an area of over 45,000ft. super. Suitable for the erection of a school or public building. Price £2000. Also several smaller plots, prices £140 to £600.—Plans and particulars of Mr. A. R. VIZARD, 12, Regent-street, Pall-mall, S.W.

The Gladstone Memorial.

It is understood that, among the various memorials which doubtless will

be erected to perpetuate the memory of William Ewart Gladstone, a statue will be placed in Westminster Abbey, beside those of Canning, Beaconsfield, and Chatham. This proposal opens up once more the question of the propriety of such proceedings, and though this is hardly the place to discuss the general question, to point out how little all human monuments accord with modern ideas of the insignificance of any individual in the general scheme of the universe, yet when it comes to a definite proposal to erect another white marble statue in the Abbey, all those who love this venerable structure are more nearly interested. Westminster Abbey is a temple for the worship of the Deity, not for the glorification of man. Those who look upon it in this light may well question the good taste of placing any human monument whatsoever within its sacred walls, may well ask themselves whether such a proceeding is in accordance with the eternal fitness of things. If such monuments must be, cannot they be outside, or in a building designed for their reception? From the strictly artistic point of view, it is difficult to see how one can insert a modern addition to a mediæval design without destroying its unity of conception. Either the addition is a true work of Art in itself, modern in idea and in sentiment, when it will be out of harmony with the original work; or else it will be an attempt to work in an obsolete style, with ideas and sentiments out of touch with modern life—a work of archaeology, not Art. And even though it were possible—which it is not—to produce monuments which were artistic, and at the same time in character with their surroundings, yet even then our Cathedrals were not designed for this purpose, and the few places where monuments might be placed in them without detracting from the general effect are usually occupied by specimens of contemporary work. Westminster Abbey is—particularly the north transept—perhaps the worst example of a glorious interior utterly ruined. Its monuments may be the monuments of a nation's gratitude, but they are also monuments of a paltry vanity, and a vulgarity of feeling that is indescribable. They spoil the proportions, choke up the vistas, and are utterly out of place and out of harmony with the spirit of the building. A public taste that would tolerate them would tolerate anything. In this country, unfortunately, artistic opinion is rarely consulted on matters artistic, so no doubt someone will be asked to attempt the impossible, and add yet another to this chamber of incongruities. Is there any hope that at any rate we may be spared a white marble figure on an absurd pedestal? Could not the monument take some other form. Could it not at least be in bronze? It is conceivable, by those who have a robust faith in the

progress of humanity, that some day—may it be soon!—popular opinion will revolt at these monstrosities, and make a clean sweep of them. Gladstone was a man whose memory should escape such a fate. Surely he was great enough to need no statue in Westminster Abbey! But such is the irony of fate, that while he in his lifetime was so completely in accord with the spirit that broods over the Abbey, now he is dead his

OLD CHURCHYARD CROSS AT CARDIFF. THE HEAD AS RESTORED BY O. E. FOWLER, F.R.I.B.A.

countrymen can find no better way of showing their sense of his worth than to put up his effigy, to be a continual discord, a jarring note, in that harmony which, in his lifetime, he loved so well.

A. R. J.

The New Town Hall for Paddington.

It is with mixed feelings that we learn of the proposal to build a new Town Hall for

Paddington; a proposal which, by the way, is likely soon to become an accomplished fact. There can, of course, be no two ways of thinking if we have the plain question put, "To be or not to be?" for in these democratic times a local centre for the due manifestation of local patriotism is needed in every township and every self-governing district. These are the times when every village has its "Hall," and when, therefore, we cannot expect such centres as Paddington (for example) to go lacking. Look where we will in London, nearly every district has its town hall, of more or less recent date, and of greater or lesser artistic merit. From West Ham in the East to Hammersmith in the West, these municipal palaces are rising, and we may hope, with a reasonable expectation of our hope being realised, that at no distant date these headquarters of local government, of local thought and feeling, will produce that sense of citizenship which Londoners lack. London is too large and has too many divergent interests, say our critics, for this feeling to have a chance of existence; but we shall see—nay, we are just now by way of seeing, in the various schemes for the local government of London even now in the making. Upholders of, and apologists for, a central authority, may exercise their wits as much as they please upon what they have labelled "tenification," but "tenification," or, if necessary, "twentification," is in the air, and has to come, and with it the Charters of Incorporation and the Mayoral dignities that are the due of our great urban districts. We trust, however, that when these things come to pass Parliament will provide for a ratepayers' direct veto on any local undertaking of great magnitude. These are the days of rapid, cheap, and certain communication, when the arguments used against the "referendum" (or "plebiscite," whichever one elects to call it) will not work, in this direction, at least; and in future the opinions and criticisms of those who pay the piper should be suffered to select the tune. These remarks are called forth by the announcement that the Paddington Vestry has decided to build the town hall on the model of the well known town hall of Bolton, in Lancashire. We have nothing but admiration for that fine design, whose well proportioned and exceedingly dignified elevation gives majesty to the Square of that hideous cotton-spinning town in which it is situated. A classical stone building of this character is peculiarly well suited to such a place. Its breadth of design and large proportions serve as a very much needed foil to its sooty and altogether mean surroundings. Again, when the self-same design was carried out in an exactly similar way at Portsmouth, the critic could find nothing to say against its suitability, for a great naval and dockyard town would seem, from its very nature, to require buildings classical in feeling. And, in truth, the Portsmouth town hall is one of the finest things, if, indeed, not the very finest, to be seen in that great port, and has the advantage, in that clearer atmosphere, of not becoming grimed with the smoke of countless mills, as in the case of its Bolton prototype. In a place like Paddington, however, we would appear to need Architecture of the more livable, if scarcely to be called less dignified type. Paddington has no official dignities connected with it, but is rather a residential quarter, and its town hall should reflect that character. Something in the Elizabethan or Victorian Renaissance convention is required there, and it is precisely on such a question of taste that the

voice of the critic should be heard. Besides—and here's the rub for the architectural profession—how does the architect of the building to be so exactly reproduced stand? Will the Paddington Vestry consult him, and pay the usual commission for the use of the plans, as, we believe, the Corporation of Portsmouth did? Or, will they borrow the plans, and build on the cheap? Here is an argument, indeed, for copyright in architectural design. C. G. H.

THE TOMB OF OSIRIS.

BY M. E. AMELINEAU.

[Translated from the *Figaro*.]

DURING the year 1895 I had the intention of visiting Abydos, the holy town of Osiris, in order to study the temple of Seti I., which is one of the most interesting of the Egyptian monuments, and which unquestionably shows us more artistic marvels than any other in the Nile Valley.

Whilst I was making the necessary preparations towards the realisation of my desire, a group of three persons had determined to make some excavations in Egypt, and particularly upon the site of Abydos. These three persons were M. M. Sigismond Bardac, Count Henry de la Bassetière, and the Marquis of Biron. They communicated their project to M. J. de Morgan, the then Director-General of the Egyptian Antiquities, in order to obtain the necessary permission. This permission, limiting their energies to the site of Abydos, was granted them, but only on the condition that the works were directed by an Egyptologist, in order that the documents should not be lost to science. M. de Morgan very kindly thought of me, and proposed that I should take over the direction of the works, which offer I was only too happy to accept, realising my most cherished wish in wholly unlooked for conditions.

Having arrived alone at Abydos, my first care was to reconnoitre the places in which I had obtained the concession of working the excavations. It did not take me long to discover that the concession was immense, even if only the superficial area were taken into consideration. Had I limited myself to the Necropolis alone, I had a strip of land measuring nearly eight kilometres long, and in some places three kilometres broad. If it was difficult at first sight to choose a starting point, it was because, as I strolled along, I became lost in admiration of the immense sandy plain bathed in sunlight extending to the foot of a mountain which seemed to guard it still with a jealous eye, as it were a giant charged with defending it from sacrilegious profanation. From time to time I perceived the black silhouette of some enormous monument, raised formerly in this place for needs unknown, or else for some cults for ever disappeared. I saw also some poor constructions which the simple priests have built by the side of those superb monuments, and I said to myself that in spite of the grandeur of some, and the smallness of others, riches set beside poverty—the latter has invariably overcome the former.

These reflections, however philosophical they may be, did not advance me much; neither did they enlighten me at all as to the exact place at which I should commence the execution of the works.

This same necropolis had been worked at for nine consecutive years by the illustrious Mariette, the founder of the Museum of Boulaq, and I know that he admitted on the eve of his death that the excavations at Abydos had not answered to the hopes which he had every right to entertain. In the course of my wanderings in the necropolis, I had remarked several places where there had been no excavation for several autumns, and among others I noticed a brick pyramid, half destroyed, and several heaps of debris under which possibly lay concealed many important tombs. I was above all surprised at finding quite near to the mountain a series of hillocks

formed entirely of broken pottery, mixed with sand which the sand storms had accumulated there. The sight of those millions and millions of pots caused the painter, Georges Clairon, to say that all the potters of Abydos must have made a rendezvous of this place in order to dispose of all their spoiled wares, and this for several centuries.

These hillocks, which were six in number, were not contiguous, neither were they of the same dimensions, or equally spaced one from another. Some of them were very small, while others were immense, the largest being not less than 140 metres long by 109 broad, with a height of from seven to eight metres. So I decided to interrogate these hillocks; it was a huge undertaking and would require a considerable time to complete. I saw this when I made my first examination, but I felt drawn by an irresistible force towards the place. After some weeks of survey, I took with a firm hand the direction of the excavations, and led my men towards the heaps of pottery which the natives call "Om el ga'al," which is to say, "The mother of the bowls." I did not leave the works after having once commenced them, and it is upon this site that I discovered in the first year the prehistoric dynasties of Menes, in the second the tomb of Set and of Hams, and in the third year the tomb of Osiris, for which Mariette had sought fruitlessly for nine years. And not only have I discovered in the hillocks which I have excavated, the monuments just enumerated, but also evidences of the state of civilisation in which men lived at an epoch which cannot be less than from seven to eight thousand years before our era. I have been able to verify also the fact that even at that remote age the greater part of the arts which are practised in our day were then already cultivated; that this culture had progressed so much already that the artists of those far-off ages were capable of real masterpieces; that, in particular, the Stone Age was far from being an age of barbarism, as we in Europe are too prone to believe; that the men of those days knew how to carve every kind of stone, even the hardest, such as diorite, or the most friable; they even at that early date knew how to carve rock crystal with consummate ability. Writing had been invented; I found stiles covered with hieroglyphics of the same nature as those employed later in historic times, but which are yet unknown. The art of sculpture had made astounding progress; Architecture was established; the art of painting was in its infancy. Industrial art was already capable of work in bronze. The potters' Art, though clumsy, could nevertheless produce work of very large dimensions. They were perfectly acquainted with the art of working the hardest woods, of doing marquetry, and had already discovered the secrets of the art of making enamelled glass. In a word, almost all primitive human industries were then known and practised. Certain details of objects discovered show that the relations of races were far more extended than has been supposed. The coffins in which the corpses were inclosed were made of cedar; this could only have been if relations existed between Egypt and Syria; in like manner we find ebony from Central Africa; and I found skeletons of dwarfs, which may perhaps have come from ancestors of the tribes discovered and described by Stanley in "Darkest Africa." And not only have I discovered proofs of human industry of the arts and the races of that epoch, but also undeniable evidences of the cereals then used as food. I neglected nothing of all that I discovered in the course of my excavations, persuaded that things devoid of interest for some might yet be of the deepest interest to others. In this way I have gathered together a very rich collection of objects of all kinds, which are now being submitted to scientific analysis, and to the examination of specialists. Yet more, whenever any part of the excavations has yielded objects particularly interesting to science, my companion, M. Lemoine, a real artist in photography, took photographs with the greatest willingness, and with a skill beyond all praise.

Thanks to my system of gathering together

the smallest objects, I have discovered that the religious disputes—rife in Egypt during the sixth century of our era, when the Christian religion had definitely established itself in the valley of the Nile—must bear the blame for those reprehensible spoliations; for not only have I discovered undeniable traces of the passage of the spoilers, but even their names written in charcoal on fragments of pottery; so that for all the problems which have arisen during these excavations we have the elements of solutions, and that these solutions may be found very shortly. For this reason I have not been at all surprised at the stir made by the Abydos excavations throughout the scientific world, because I know they deserve both the fame and the favour they have received.

AN INTERESTING CHURCHYARD CROSS.

A FEW weeks ago we referred to the long-drawn-out restoration of Cardiff Parish Church, and this week, on our front page, we illustrate the head of the old churchyard cross, which has also undergone restoration, and which, in its present position in the churchyard, is intended as a memorial of the work of restoring the church, which has been in progress for the past ten years. In olden times people were in the habit of raising landmarks and monuments in the shape of market crosses and churchyard crosses. In many cases these structures and their associations form the most interesting episodes in county or ecclesiastical history. The parish of St. John, Cardiff, was furnished with its churchyard cross, erected, perhaps, four centuries ago, but by the beginning of this century the elements had done their work so effectually that nothing but a meaningless stump was left. With such an extensive restoration of the church in hand, Canon Thompson, the Vicar, conceived the idea of re-establishing the church cross. The dedication of this cross—which is a very beautiful object in itself—was performed on a recent Sunday, the first suitable opportunity after the structure had passed out of the workman's hands. The architect chosen when the task was decided upon was Mr. C. B. Fowler, F.R.I.B.A., of Cardiff, who has been employed all through the church restoration. We have mentioned that a stump of the ancient cross remained. It was decided to utilise this, but upon examination it was found that a large foundation had been covered by earth, and this also was restored. The shaft has been added to, and a fine ornamental head provided whilst the socket rests upon a massive base running up in steps, the whole measuring up to a height of 18ft. The shaft and head are of best Portland stone, and the carving was carried out by Mr. W. Clarke, of Llandaff. The design of the head represents the crucifixion on one side and the ascension on the other side, surmounted by a canopy and crocketed pinnacles. The face of one of the steps at the base bears the inscription:—

FINIS CORONAT OPUS, 1898.

— LAUS DEO. —
1887—1898.

"It may interest your readers," writes Mr. Arthur C. Blomfield, "to know that the three squirrels of Messrs. Goslings (Fleet Street) will be affixed to the window bars in the new building in the same position they formerly occupied, and that the watch-box is preserved in the museum at the Guildhall."

THE Lord Mayor of Liverpool opened, last week, another institution in connection with University College in that city. This is Ashton Hall, a museum and school of hygiene. The building was presented by the late Mr. George Holt, and afterwards remodelled. It is a large building, with well-lighted museum, laboratories, and lecture room, the latter fitted with an electric air lamp. The museum rooms are well-fitted, and are always stocked with numerous useful exhibits.

ACADEMY ARCHITECTURE.

BY A SPECIAL CORRESPONDENT.

THE Architectural Room at the Royal Academy can scarcely be said to be at its best this year. The most that can be said is that it is interesting both in the variety of its subjects and in the quality of its drawings. The gallery, however, is an improvement on last year, the three models giving additional interest. One would still wish to see less perspective drawing and more geometrical design, and possibly, as years go on, exhibitors will be content to show geometrical elevations, although, perhaps, in this case there would be even less to incite the general public to visit this room, which may or may not be a good thing. Where the geometrical elevations can be supplemented by a perspective, or even by a model, the result is all that can be desired.

With regard to the models, the largest and most important is "A Model of the South-west Angle of the New Museum and Technical School, Liverpool" (1804), exhibited by Mr. E. W. Mountford. It shows a part of the side elevation near the angle of the building. We are inclined to think that the rustication is rather overdone. Close by is hung a perspective view of the building, and here we are able to compare in an interesting way the model with the drawing. Mr. John Hawes exhibits (1805) a prettily-tinted model of a design for a Westmoreland church, presumably on a hilly site. The design is of a simple character, with plain buttresses and round-headed windows at the side, within a recessed segmental wall arch abutting against the sides of the buttresses. The other model is hardly so satisfactory. It shows a house at Haslemere, certainly picturesque, but the colouring is not all that could be desired. To come to the drawings, we will first consider the work of the Academicians. The place of honour is occupied by the diploma work of Mr. T. G. Jackson, R.A., who, in one of his delightful drawings, illustrates the New Schools, Oxford. The style is that type of free classic which Mr. Jackson has made so decidedly his own, especially at Oxford. Mr. Jackson also exhibits the new chapel of Giggleswick School (1647) and the new buildings for Uppingham School (1648), in the latter case the buildings adjoin those designed by Street, and we cannot but help admiring the way in which Mr. Jackson has made his work harmonise with that of Street. The Giggleswick School is rather more out of Mr. Jackson's usual type than the other two exhibits; the central feature is a leaded octagon cupola, the walls supporting it being treated with a slight batter, which, as the site is a hilly one, gives a great appearance of solidity.

Mr. George Aitchison, R.A., exhibits a decoration in marble, mosaic, and paint, the effect of the colour combination is rich.

Sir Arthur W. Blomfield, A.R.A., shows a drawing, by Mr. Roland Paul, of the interior of the new chapel at Malvern College, it is of the usual collegiate type, and hardly calls for comment. Mr. J. F. Bodley, A.R.A., has two interesting exhibits—Chapel Allerton Church, Leeds (1712), and a pulpit for St. Michael's, Croydon (1714).

There are not so many exhibits of public buildings this year as usual, but we must single out the design for the new Municipal Buildings and Law Courts at Cardiff by Messrs. Lanchester, Stewart, and Rickards. The design has been very considerably improved; since the competition drawings were shown the buildings appear to have been somewhat raised, which, if we remember rightly, was the recommendation of the assessor, Mr. Waterhouse. The buildings are shown by a perspective from the hand of Mr. Rickards, which is quite a masterpiece in its way.

Mr. Belcher shows his design for Colchester Town Hall, illustrated by a large and boldly coloured perspective, as well as by geometrical

drawings of the details of the tower. These are of particular interest. Mr. Belcher shows also his design for Cambridge Guildhall (1734), which is even more satisfactory than his other exhibit. The front consists chiefly of three projecting masses, the end wings solid, the centre one with open columns. On the ground floor is a loggia and balustrade. The two end wings are surmounted by massive stone globes, which form a very curious feature of the design. Mr. Bryden and Mr. Beresford Pite both exhibit designs for Colchester Town Hall, the former having a dignified elevation, consisting of two stories of rusticated wall and a sculptured frieze, the upper story being treated with columns; while Mr. Pite shows an elevation consisting principally of three large arches, the whole height of the front. This drawing suffers much from being skied.

Messrs. Gordon, Lowther, and Gunton exhibit the Royal Masonic Institution for Boys, at Bushey. It hardly appears so successful a design as we should like to have seen for so important a building.

(To be continued.)

A NEW United Methodist Free Church, Buttrills Road, Barry Dock, has been opened.

EGYPTIAN ARCHÆOLOGY.

THE RESULTS OF RECENT RESEARCHES.

IN the field of Egyptian archaeology few have accomplished so much, whether in the richness and variety of the actual objects discovered or in harmonising fresh results with the work of other scholars and explorers, as Professor Flinders Petrie. Egyptologists in recent years have done much to reconstruct and present the evidences in material form of a civilisation extending through many centuries before connected history begins, and a valuable addition to their labours, says the Times, has been made during the past season by Mr. Petrie and many fellow-labourers, and the results of their work are now on view at University College, Gower Street, to the 30th inst. The exhibition includes

ANTIQUITIES FROM THE EXCAVATIONS of the Egypt Exploration Fund at Denderah, about thirty miles north of Thebes, and those of the Egyptian Research Account at Hiera-

JAMES MALLOW'S AND
GROCKOCK ARCHTS

A SKETCH AT THE ROYAL ACADEMY.

konpolis. The resources of the former have to the extent of one half been devoted to Denderah, the other half being still needed for Deir-el-Bahri. The history of Denderah, Professor Petrie tells us, as reflected in its cemetery, is a beginning in the fourth dynasty, a flourishing age from the sixth to the eleventh, and then a later prosperity in the Ptolemaic and Roman times. This work, extending about half a mile back from the temple enclosure, and lying along about a mile of the desert, was carried on by Professor and Mrs. Petrie, Mr. Arthur Mace, Mr. Norman Davies, and Mr. MacIver. The work of the Research Account was a continuation of last year's, and Mr. Somers Clarke and Mr. J. J. Tylor joined resources with it to enable Mr. Quibell to carry on his excavations at Hierakonpolis opposite El Kab. Previously the

REMAINS OF PRIMITIVE KINGS

were all sepulchral, but here have been discovered for the first time monuments of war-

ancient objects. It is claimed for Mr. Quibell's finds that many of them date before the fourth dynasty, or about 4000 B.C. The cemetery upon the desert yielded pottery of the types well-known in the later New Race graves of Naqada, which go even behind the earliest kings. The later types are similar to those found in the tomb of Menes and are assigned to the first dynasty. Among the things found are many of the familiar slate palettes, mostly of the later square type, one in the form of a scorpion, others with gazelles and giraffes and other animals, real or mythical, delineated with a wonderful vigour and freedom. In one place in the temple area was found a trench filled with ivory carvings buried as offerings. It needs an expert, unfortunately, to see that they are ivory, to such an extent are they rotted away and encrusted with lime; but they are of great interest as representing very early people, probably of the second dynasty. The male figures mostly have scanty pointed beards and sharp features, like the heads of

pretation is "oxen 400,000, goats 1,422,000, captives 120,000." The most striking item, however, is the model of the great palette now kept at the Gizeh Museum, exhibiting a curious diversity of human types, only one of which is of the later Egyptian. Two are bearded men with long hair like the men shown in the tomb of Pahari at El Kab, and reproduced in Mr. Tylor's beautiful book. The design is very elaborate, with many figures of men and animals, and seems to indicate an alliance between several distinct races. This is considered to be the most important

HISTORICAL MONUMENT OF THE EARLY KINGS.

Professor Petrie's work at Denderah affords results extending over a vast period. One is a stele of the third or fourth dynasty of a prophet of Hathor Suten-abu, which stood over the elaborately-carved false door, which is like sculpture of the third dynasty in the Louvre. This was the only sculpture found in

A HOUSE:

ARCHITECT:

A SKETCH AT THE ROYAL ACADEMY.

fare and of history known to belong to the earliest dynasties. The excavations were assisted and plans drawn by Mr. Somers Clarke, Mr. F. W. Green, Mr. Peers, Miss Pirie, and Miss Quibell. We are reminded by Professor Petrie that the present exhibition is even more than usually disproportionate to the actual discoveries made, as what from his point of view he naturally terms the exactions of the Gizeh Museum have even exceeded the half which it can lawfully claim. The Egyptian Government requires the gratuitous surrender of all the most valuable objects, and taxation is imposed on the explorer even in respect of what he is obliged to leave behind him. This appears to be a substantial grievance; but, all drawbacks notwithstanding, Professor Petrie and his fellow-workers have reason to be proud of what they can show. The distinctive merit of these recent researches is that they appear to fill a large intermediate space between the aboriginal and the historical period, and extend our knowledge far back into what were the

MISTS OF A RECORDLESS ANTIQUITY.

And that which is still more astonishing is the beauty and finish and the free and unconventional character of many of the most

of the New Race of pre-dynastic times, and probably represent the Libyans who then occupied Egypt. Nearly all wear girdles, and most have a dagger sheath in front, and only one has the usual Egyptian kilt. The female figures are nearly all nude, with long wavy hair to the waist and two locks hanging in front over the breasts. These, on account of their nudity, are taken not to represent living persons and bear no sacred emblems to connect them with any dieties. These female figures are of the dwarf bandy-legged type familiar in figures of Ptah Sokar, and on one is a close-fitting garment reaching to the knees. Other figures are outlined upon

IVORY CYLINDERS AND PLAQUES

—one with the Ka name of King Nar-mer, holding a staff smiting bound enemies. Wands, models of boats, bowls and stone vases, maces, alabaster dishes and porphyry bowls, green glazed ware of very early date representing monkeys, pigs, calves, oryxes, pelicans, scorpions, and other animals, also claim attention. The great limestone maces with relief sculptures are of extraordinary interest and beauty; and on one are several male figures, the King among them, beautifully wrought, and at the base hieroglyphs whereof the inter-

the group of great brick mastabas of the earliest style. On the surface of the desert were picked up great quantities of worked flints, mostly of palæolithic types, but statues such as are common in the Old Kingdom cemetery at Memphis are rare at Denderah, and only one large one was found of Prince Adui. The great mastabas of the princes of the sixth dynasty proved the most important in the cemetery, the series including Princes Mena and Adu under Pepy II., Prince Adu II., one nameless, Prince Merra, and Prince Beb. Bowls of the Old Kingdom and much pottery of the Middle Kingdom, probably of the eleventh and twelfth dynasties, are also displayed. The catacombs for sacred animals, consisting of brickwork tunnels branching from main galleries, extended over a large area, and among the bones was a large quantity of

BLUE-GLAZED OBJECTS OF TEMPLE FURNITURE.

These appeared to belong, by the names, to the eighteenth dynasty. There are also sculptures of Prince Merra, with his wife Beba and his daughter Duduerclutsa, which are assigned to the close of the sixth or early in the seventh dynasty. The style, though becoming degraded

and clumsy, retains the character of the Old Kingdom. Other objects are a flint hoe of the Old Kingdom, a set of funereal model tools, a stone button of a foreign type, beads, pendants, necklaces of the Middle Kingdom, alabaster vases, a fine flint knife, and a hollow silver bangle. Of bronzes, two important finds were made, both of temple furniture, which had probably been buried in the confusion of the twentieth dynasty. One of the most interesting of the exhibits is a beautifully-carved group of Mentuhotep, son of Bebbu, and his wife Nefermesut, daughter of Hepy, probably of the eleventh dynasty. The man's head is lost, but the woman's is equal to the best work of the Old Kingdom. There are also other carefully-carved pieces of the tenth or eleventh dynasty, and on one is an inscription of the type often found in that district, giving a catalogue of possessions. Some of the figures display the same feeling as that which is discernible in many island statues in Cyprus and the Archipelago. Besides remains of early date were found Roman glass, coins of Diocletian and other Emperors to the time of Constantine. The catacombs also disclosed many bodies of animals, cats, goats, ibises, and snakes, and, in the later tunnels, the ichneumon, monkey, and dog. Seldom has a collection been brought together of a variety so great and extending over so vast a period of time.

A CITY SCHOOL EXTENSION.

AN important extension of the Guildhall School of Music was opened last Monday. The extension is a much needed improvement. The additional land which the new building covers measures 72ft. by 57ft., or an area of 3700ft. super. The ground and first floors of the new building are occupied by a spacious orchestral saloon, extending to nearly the whole space, with a maximum height of 30ft., and affording seating accommodation for 650 persons. The stage is 47ft. by 14ft., and 27ft. high. In the basement there are a number of dressing-rooms in connection with the stage. The number of class-rooms is thirty, but, as three of the class-rooms in the present building are required for access to the new wing, the net gain is twenty-seven rooms.

EMERGENCY EXITS,

4ft. wide, are provided on each side of the saloon, three doors discharging directly on to John Carpenter Street, on the east side of the saloon, and at the level of the pavement, and one into the Girls' School by means of a gangway on the west side. The gallery is provided with two emergency exits, one on each side, discharging into John Carpenter Street and the Girls' School respectively, the latter by means of a bridge. From the dressing-rooms in the basement a means of escape is also provided into the playground of the Girls' School. It is satisfactory to know that no open fireplaces will be allowed, the building being heated throughout by hot air, while all the floors are fire-resisting. The walls to the rear are faced with white glazed bricks, and the front elevation with Portland stone. The style of architecture is somewhat similar to that of the present building, but, owing to the greater height, the detail is bolder, and

THE PIERS AND PILASTERS

are presented in greater relief. The time will come, of course, when the old building will be raised another story, and with a continuation of the handsome roof of the new extension an architectural proportion will be realised. When that is done—perhaps before—the principal entrance to the school will be made in John Carpenter Street, which is, undoubtedly, the proper place for it. The doors on the ground floor of the extension are only emergency exits in connection with the orchestral saloon. The word "theatre" might, perhaps, be more correctly used instead of that of saloon, but there are obvious reasons why it should not be described as a theatre.

AT THE ROYAL ACADEMY: DESIGN FOR A FIVE-LIGHT STAINED GLASS WINDOW. "SCENES FROM THE LIFE OF CHRIST." BY WILLIAM AIKMAN.

A BRONZE MEMORIAL BY
GEORGE J. FRAMPTON, A.R.A.

A SKETCH AT THE ROYAL ACADEMY.

Mediæval Halls in Lancashire.

THE Historic Society of Lancashire and Cheshire recently visited several of the mediæval halls of South Lancashire. The ancient hamlet of Newbold, where a family of that name was settled as early as the time of King John, was first under survey. The old hall of the Newbolds, a many-gabled building with a small courtyard, existed till the year 1840, but at present its only remains comprise the gateway and the large masses of granite which formed the quoins to the angles of the building. After inspecting the relics and surroundings of what must once have been a residence of considerable proportions, the party drove to Belfield Hall, a mile distant. Adam, the son of Henry de Belfield, was living here in 7 Ed. I. (1278-9). About the middle of the sixteenth century the Belfields left the place, and a branch of the family settled at Cleggswood and Clegg Hall, Belfield being afterwards the seat of a branch of the Butterworth family, the last of whom, in the direct line, died unmarried in 1714. Ultimately the estate passed to Richard Townley, who had been steward to the Butterworths, and who was High Sheriff in 1752, in which year he refronted and probably

SPOILED THE OLD HALL.

The Ven. Archdeacon Wilson, rector of Rochdale, here exhibited a curious ground plan of the Hall as it used to be. The place is now in utter decay, but bears ample evidence of the unfortunate attempts made to improve its ancient characteristic Architecture. Clegg Hall was next visited. This occupies the site of an older building known as "Clegg," where in 1550 Ralph Belfield was living, and whose son married a daughter of Edmund Hopwood, of Hopwood. From his issue the estate descended to the Assheton family, who, in

1618, sold the Hall to Edmund Howorth. The present building, which was erected early in the seventeenth century, was described in 1626 as a "faire capital messuage, built with free stone, with all new faire houses of office thereunto belonging, with gardens, fishponds, and closes of land." The Hall is still an ornate building, though all its rural accessories have departed, and it now stands in juxtaposition to a railway and a canal, which destroy all semblance to the picturesque and reposeful beauty it must once have enjoyed. This Hall, it may be mentioned, is the scene of Roby's "Clegg Hall Boggart." The party now drove towards Rochdale, passing the sites of

BUCKLEY, HAMER, AND HOWORTH HALLS, and also "The Great House" at Amen Corner in Rochdale, the oldest house in the town. This district is, of course, classic ground to the admirers of the Lancashire worthy, "Tim Bobbin," who was born in the neighbourhood and lies buried in the churchyard, his simple grave being duly visited by most travellers. Rochdale Church, founded about 1194 and several times rebuilt, was inspected, its interesting features being pointed out by Archdeacon Wilson, not least among them being a very curious ancient font, which, after lying hidden in the ground upwards of 250 years, was discovered in 1892 and once more set up in the church. After being shown through the very handsome interior of the Town Hall, the party proceeded to the Public Library, where is preserved a fine collection of the MSS. and sketches of "Tim Bobbin."

GOLDBER'S HILL has been sold by Messrs. Debenham, at the Mart, Tokenhouse Yard. It consists of a residence and thirty-six acres of well-wooded land, and belonged to the late Sir Spencer Wells. The purchaser secured the property for the sum of £38,500.

ARCHÆOLOGICAL CONGRESS.

THE PRESERVATION OF ANCIENT MONUMENTS.

THE tenth annual congress of archæological societies was held last week in the rooms of the Society of Antiquaries at Burlington House, London. Lord Dillon presided. The first subject that came up for discussion was the national portrait catalogue. At the congress held in 1896 Mr. Lionel Cust, director of the National Portrait Gallery, was invited to prepare a form to be filled up by persons possessing portraits of historical interest, with a view to compiling a complete catalogue of such portraits existing in private collections. This form or schedule has now been printed. Mr. Stanley Leighton, M.P., brought forward a proposal to offer an inducement to the owners of

HISTORICAL PORTRAITS

to have them scheduled by exempting all portraits considered by Mr. Cust to be of adequate merit from legacy duty.—Mr. T. W. Shore seconded the motion, and said that he hoped to see this principle of exemption from legacy duty extended to the owners of ancient monuments also.—In spite of some opposition the resolution was carried.—Attention was next directed to the Blue Book issued July 30, 1897, containing information collected by our Foreign Ministers as to the means adopted in the different European countries for the protection of ancient monuments. The statement in this Blue Book that the only two nations whose Government did absolutely nothing for preventing the destruction of ancient remains were England and Russia is sufficiently humiliating to any educated Englishman. As it was quite hopeless to expect any help from the Government, it was proposed that copies of the Blue Book should be forwarded to the County Councils and Antiquarian Societies throughout the country, with a suggestion that these bodies should ascertain what ancient monuments it was desirable to

TAKE STEPS TO PRESERVE.

and how this could best be effected.—A delegate protested against a proposal which, he said, meant shifting the responsibility of keeping ancient buildings in repair on to the shoulders of the already heavily burdened ratepayer. On the other hand, it was pointed out that old structures were often swept away quite unnecessarily in order to make a job for an architect and a builder, so that in many cases the antiquary might be the means of preventing the ratepayer's money being squandered.—The Rev. Dr. C. J. Cox mentioned that, as a member of the Northampton County Council, he had found his colleagues, irrespective of party, anxious to save old buildings wherever it was possible to do so; and he gave the fourteenth century bridge over the Nene and the Queen Eleanor crosses as instances in point.—Lord Dillon remarked that in all the county councils there were men of culture fully alive to the value of relics of the past, and it was the duty of those who were educated already to educate those who were not.—Mr. G. L. Gomme said that the London County Council had already prepared

A SCHEDULE OF ANCIENT BUILDINGS.

with a view to their preservation.—Eventually the congress resolved to communicate through its secretary with the various county councils on the subject, calling their attention to the recently issued Blue book on the preservation of ancient monuments abroad, and also to the steps taken by the London County Council in the matter.—The reports of the Committee on Effigies and of the National Record Association were afterwards discussed.—A fine series of photographs of antiquities was exhibited by Sir Benjamin Stone, M.P., president of the National Photographic Record Association.—It was unanimously agreed that this Association had inaugurated a most valuable work, and that it was desirable that the local archæological societies should give the Association their hearty co-operation.

CARSHALTON COMPETITION.

DESIGNS FOR A CONVALESCENT FEVER HOSPITAL IN SURREY.

BY OUR OWN CRITIC.

THE ten designs sent in for this limited competition have been on view during the last fortnight at the offices of the Metropolitan Asylums Board. They were only shown to competitors and the Press. The three premiated designs, selected by Mr. Henry Currey, F.R.I.B.A., the assessor, were in the Board-room on the first floor, and the remaining seven relegated to a room in the basement! Such an arrangement is not to be commended, as it rendered comparison a laborious task, and the fact of none of the designs being hung added to the difficulties of an examination of their relative merits.

The conditions issued to the invited architects were very complete. Briefly, the scheme embraced provision for thirty isolated double cottages, each pair containing accommodation for twenty-four patients, and arranged in groups of five, so that each group should be under the control of one sub-matron. A double cottage had to provide separate and distinct accommodation, consisting of two dormitories of twelve beds each, allowing not less than 80 square feet and a lineal wall space of 8ft. per bed; two day-rooms, with 60ft. super floor space per patient; a room in each cottage for the "house mother," together with sculleries, safes for food, linen rooms, recesses for brooms, and bath and ablution rooms; also a separation ward, three w.c.'s, and a slop sink to each double cottage. To every group of five cottages, an adjacent building for the staff had to be provided, containing a sub-matron's bed and sitting room, sitting and mess-room for three night assistants, and accommodation for seven maid servants.

The isolation wards had to provide for eighty beds, forming a small hospital in itself. The administrative block, with rooms for medical officers, superintendent, dispensary, stores, kitchen block, and male and female quarters, had also to be arranged, as well as a laundry, houses for medical superintendent, steward, engineer, porter, and workshops.

The conditions do not appear to have stated whether the double cottages should be one or two-story buildings; consequently some show the accommodation on one floor and some on two. A single-story building is undoubtedly preferable in theory, but a few competitors have apparently adopted the double-story cottage as being more economical and practical on such a sloping site. A very considerable fall in places will make the levels difficult to manage when the buildings are spread over so large an area, and will probably necessitate a good deal of levelling. As the sub-soil is likely to be chalk, this might be a costly undertaking.

The crux of the problem was to plan the buildings so as to get the best aspects, to make

them a sufficient distance apart, and yet to arrange for economical service from the staff and administrative blocks. An axiom in hospital planning is to get as much "blow through" around the buildings as possible, and therefore to avoid "dead" corners where the air would be likely to stagnate; in a convalescent hospital these considerations are not so important, and it is evident that the assessor has considered them to be rather a disqualification than otherwise in making his awards, when applied to the arrangement of the double cottages. The main difference between the selected design by Messrs. Treadwell and Martin, and some other clever schemes is the southern aspect they give their day-rooms and airing courts, and the shelter they obtain for them from the north and east winds.

A rough sketch of Messrs. Treadwell and Martin's block plan is appended. The entrance and administrative blocks are on the north, and from the latter a covered way leads due south to the isolation wards, which are placed hospital fashion. Six lines of covered ways branch obliquely from the axial covered way, three on the east and three on the west, and each branch leads to its group of five double cottages on the south, and staff block on the north. An outline sketch of ground plan shows the arrangement of a double cottage. The separation ward is placed in the centre, the sculleries and day-rooms on either side, and the house-mother's rooms and linen closets at each end, the whole forming a block whose axis is east and west. The dormitories project on either side of this block towards the south; they are shown to be heated by means of central pedestal stoves, but we doubt if such an arrangement will admit of sufficient space between the beds in a ward only 20ft. wide. A covered verandah runs along the south side of day-rooms. The sanitary annexes, consisting of bath and ablutions rooms, w.c., and slop sink, form projections on the north, and are well disconnected. A lavatory and w.c. is placed off the covered way on the north of separation ward. Each house-mother's bedroom commands a dormitory. The administrative block, male and female servants' quarters, and stores and kitchen block, are placed in contiguous buildings to the north of site and in the centre, the medical superintendent's house and porter's lodge on the north-east, steward and engineer's cottages on the south-east, with laundry and workshops beyond.

The good points in Messrs. Treadwell and Martin's design are the excellent arrangement of cottages on the site, giving sunny aspect and shelter from north and east to the day-rooms and airing courts. The cottages are also well planned in themselves, and could be economically supervised. The elevations are simply treated, with a few "curly" brick gables, coped with brick and tile creasing, and the eaves have a good projection.

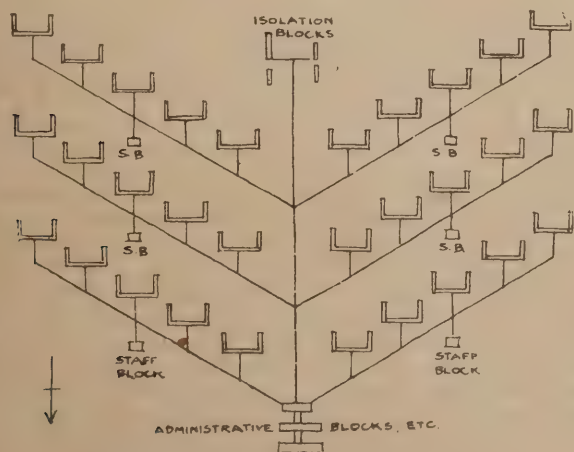

The defects noted in the scheme are the position of the isolation blocks on the south, from which the prevailing winds would be likely to carry infection to the cottages. The

administrative block is not well put together, and the position and planning of male and female quarters could be much improved. These are, however, minor defects that may be remedied before the contract drawings are made, and we agree with the assessor's award.

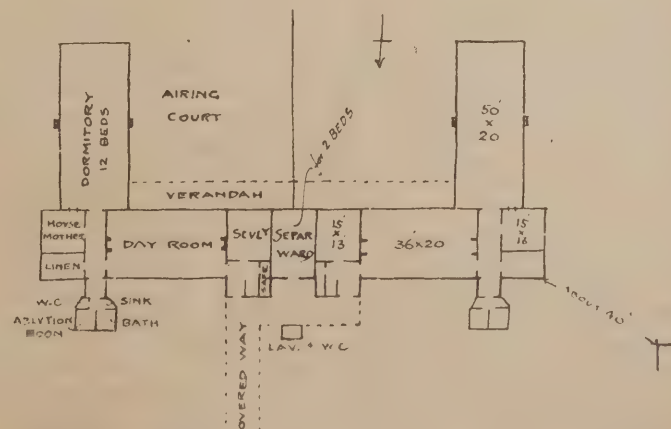

Messrs. Treadwell and Martin also submit an alternative scheme in which the double cottages are arranged on two floors: they form L-shaped buildings, the day-rooms on the ground floor and the dormitories above. The block plan is somewhat similar, but the covered ways from central corridor project at right angles east and west instead of obliquely. The scheme is not so good as the accepted design.

The second premiated set of plans are by Messrs. Pennington and Sons, who have arranged their cottages and staff blocks along four lines of covered ways from north-east to south-west, with radial covered ways from north to south. The cottages are single story buildings with dormitories in the centre, and day-rooms forming projecting wings on the south. The position of the house-mother's room is good, as it commands both the day-room and dormitory. The separation ward is a projection on the north, with entrances to it from each dormitory, not a good arrangement. Three w.c.'s and a sink are placed in a sanitary block on the south and are common to both cottages and the separation ward. A great objection to this scheme is that the distribution of cottages over so large an area would render the distance of service from the central kitchen and administrative block on the north very considerable. There would be an enormous length of covered way to traverse and the lines of communication are indirect. The arrangement of cottages and staff blocks on the curve give each set of four a slightly different aspect, varying from about south-east to due south, and some of these buildings appear to shield each other from the sun's rays. Altogether, we consider this scheme much inferior to the first design.

The third premiated design, by Messrs. Newman and Newman, shows a still more complicated block plan. The administrative buildings are placed on the west, with a covered way from them leading due east. Intersecting this and at right angles are eight covered ways, four on either side, the inner and outer ones terminating in semicircles. A garden, with a water tower in it, is arranged in the centre of the horseshoe, and radial lines of covered ways connect the inner and outer semicircles, thus dividing the horseshoe into eight spaces, four on either side of the central axis. The cottages and staff blocks are arranged in these spaces with their long axes north and south, the airing courts being on the west. The double cottages are single story buildings, and the arrangement of separation ward and sanitary annex show the same defects as in the second premiated design. We note that the block plans of both Messrs. Pennington and Sons and Messrs. Newman and Newman are on large strainers, much beyond the size laid down in the conditions.

ROUGH SKETCH OF BLOCK PLAN

A DOUBLE COTTAGE: SKETCH OF GROUND PLAN.

CARSHALTON CONVALESCENT HOSPITAL COMPETITION. THE SELECTED PLANS. BY MESSRS. TREADWELL AND MARTIN.

This enables them to show the whole site, and gives them an advantage over the other competitors.

Among the seven designs in the basement room we noticed three that bore the evidence of much thought and study. Their primal disqualification was no doubt the fact that they endeavoured to gain the greatest possible circulation of air around their cottages, and, consequently, sacrificed shelter and a southern aspect for their day-rooms and airing courts. Messrs. Greenaway and Smith submitted a careful and well thought out scheme, in many respects superior to the premiated designs. The block plan shows the administrative buildings to be on the west of site, with a service road running from it in an easterly direction. The double cottages are in groups at right angles to it on either side, each group consisting of six buildings arranged in two lines. Three cottages are placed in one line and two in another, with the staff block between. The axis of cottage blocks is slightly east of north and west of south, this aspect being generally recognised as giving the greatest amount of sun all round a building. The double cottages are on two floors, and appear to be well planned. The administrative block, isolation wards, servants' quarters, &c., compare favourably in arrangement with the selected design. The length of service roads seems to be shorter than any scheme submitted, measuring approximately from the kitchen block to the furthest cottage, 350yds., as against a distance of 500yds. in the first premiated design. The compact arrangement of the buildings and their position on the site, would make the levels of the ground more easy to treat in this design than in any of the others. Another two story design which deserves mention is that by Messrs. Thomas and Sons, who have hit upon an ingenious scheme. The administrative buildings are arranged on the north of site, with a central covered way running from them due south. Three lines of corridors branch from this axis at right angles to it and on either side, with five double cottages arranged along each. The cottages, planned in the form of parallelograms with their long axes north and south, are intersected centrally by the branch covered ways. The staff blocks are placed close to the central corridor. In this design more sanitary accommodation is provided than was asked for, no less than seven w.c.'s and two sink rooms being given to each double cottage. Mr. E. T. Hall's scheme also has many points to recommend it, though the buildings appear to be designed more for a fever hospital than a convalescent one.

A NEW children's ward has been added to the Rotherham Hospital.

THE handsome group of buildings at the corner of Cormont Road, Camberwell, is to be known as the Kennington Day Centre for Girl Pupil Teachers.

THE Bradford Association of Architects visited Pateley Bridge recently, and saw the extensive works in the valley in connection with the Bradford water supply.

EFFORTS are being made to raise money in order to add a tower and spire to Mithiam Church, in the place of those recently pulled down owing to their dangerous state.

AN indication of the value of space in the City of London may be found in the fact that the Company of Leathersellers, in its capacity of trustees of a certain charity, has arranged to grant a building lease for eighty years of a site in Gracechurch Street, with a frontage of 11ft., and a depth of 22ft. 6in., at a premium of £1000, and an annual rent of £130, the lessee undertaking to spend not less than £800 in building.

VISCOUNTESS PORTMAN has laid the foundation-stone of the Nurses' Home erected in connection with the Queen Charlotte's Hospital, Marylebone Road, at a cost of £12,000. The new Nurses' Home, which will take the place of the one compulsorily acquired by the Great Central Railway Company for their London terminus, will have accommodation for about 100 nurses and staff, and will also provide a residence for medical students.

School Buildings at Harrogate.

A NEW TECHNICAL INSTITUTE.

UP till the present moment, Harrogate has practically had to do without any properly recognised technical school, so far as an adequate building is concerned. New technical schools are now shortly to be commenced, the plans and designs of Mr. W. J. Morley, F.R.I.B.A., of Bradford and Harrogate, having been accepted in competition. The following is a description of the new school as it will be when finished: The building is designed so as to afford the greatest accommodation at the least possible cost. Owing to the peculiar nature of the site, the main entrance is placed at the north-east angle, thus leaving the two sides facing Haywra Crescent and Bower Road unbroken for the various rooms. The staircase is in a central position, well lighted, and conveniently placed for access to all departments. On the ground floor are arranged the committee-room two class-rooms (each to accommodate twenty-five students), for bookkeeping and shorthand, and a room which will form the nucleus of a museum. All these rooms face Haywra Crescent. At the back is the chemical laboratory (for twenty students), with a lecture-room adjoining, and also a balance-room and chemical store. A large manual room for

WOODWORK AND WOOD-CARVING,

to hold thirty students, is placed at the south-west corner, and at the north-west, facing Bower Road, is the room for cookery classes, with a scullery and small store-room attached. A cloak-room and ample lavatory accommodation, separate for each sex, are provided, well lighted and ventilated. On the first floor are arranged the art rooms, comprising an antique and life room, and a room for the head master, both of which are required by the Science and Art Department to face the north, and are shown with a frontage to Bower Road. The building construction and clay-modelling rooms have a frontage to Haywra Crescent, as also has a class-room for dressmaking for twenty students. The elementary art room, lecture room, and painting room (the latter facing Bower Road) are placed at the back, and are en suite, so as to be easily converted into one large room, if required. In the basement are provided a laundry for twenty-five practical students, rooms for the caretaker, heating apparatus, coal and other stores. The various rooms are planned with due regard to their uses, and have been kept separate as far as possible for each sex. The exterior of the building is of a simple character, in the Renaissance style of Architecture. A portion of the site facing Haywra Crescent is reserved for future extension. The fittings throughout will be of the most modern and approved type. In the corridors will be tiles of simple design, and dados of glazed bricks or pitch-pine boarding will be utilised in most of the rooms.

THE VENTILATION

will be carefully considered, and the corridors and rooms throughout well lighted. The report of the assessors (Messrs. Woodhouse and Willoughby) contained the following remarks:—"In accordance with your instructions, we have made a thorough and exhaustive examination of the several excellent schemes submitted in competition. We have no hesitation in awarding the set of drawings under motto 'Technical' the honourable position of first place. The author of 'Technical' has carefully borne in mind throughout the preparation of his scheme the most important question of cost, and, although, in our opinion, no scheme submitted can be satisfactorily erected under £5000, yet this design, being extremely economical both in planning and elevations, is one of the least costly submitted. The proportions of the rooms generally are good. The lighting throughout all floors is excellent, including the staircase—a very desirable point. The conveniences are well placed over one another, and with good 'cross' ventilation. The planning throughout is constructionally good, walls being over walls, and the noisy rooms isolated from the quiet ones, apart from sex."

A VILLAGE TEMPLE.

MONUMENT OF LOCAL HANDCRAFT.

MR. G. F. WATTS, R.A., has presented to the village of Compton More the beautiful burial chapel for the use of the village which he and his wife, with the help of Mr. George Redmayne, have designed, and which they have elaborately decorated by the hands of the Surrey villagers whom they have themselves trained to the work. The effect of this gift will stimulate others similarly gifted to prove to their day that there is a dormant sense of beauty in the hearts of English country villagers which can be awakened and put into action. It will, perhaps, arouse the churches of the land to believe that the hands and hearts of the villagers, if they can be trained to such power as they possess of

EXPRESSION IN WOOD OR METAL,

or stone or clay, are glad to bring their labour and their love as a free-will offering. But, most of all, that little burial ground chapel at Compton More will stand as a witness of how much of happy communion and good fellowship can be established between the simplest peasant and the most cultivated minds of our day, and will encourage those who live and work as artists in country neighbourhoods to bring their lives into nearer touch with their humble neighbours and to share their gifts with them. The work at Compton More is an object lesson for the whole land of what patience and love can do to call forth and stimulate the artistic sense which is in each one of us. When a burial chapel was desired for the new ground it was determined that an attempt should be made to enlist the villagers themselves in the work. The spirit of the fourteenth century was to be revived. A School of Art was to be called into being, and the master or, as in this case, the mistress and her scholars were to accomplish this work. This Mrs. G. F. Watts has literally done. For several successive winters she has trained a village class at her home, near Guildford,

TO MOULD AND WORK IN CLAY.

She and her husband have furnished designs and actively superintended the classes. The result has been that every house in the village has had individual interest in the progress of the work. The burial-ground chapel is not taken from heaven ready-made, but is a creation of their own hearts and hands. One cannot enter the door without finding how all the local industries have been employed. Those beautiful iron hinges and quaint locks, which contrast with the elaborate wood-carving, were designed by the well-known North-country architect, Mr. George Redmayne, but they were wrought at the village anvil by the village blacksmith. Nor is this little temple to Death only a monument of local handicraft and of the worth of the home arts and industries movement; it is a witness of the faith of the designers. The mystic of symbolism that decorates the chapel is a glorious book of life and not a joyless chapter of death, well understood by the people. As the workers worked the symbols were made plain to them. The work of their hands became a working of their brains.

THE opening of the enlarged United Methodist College buildings at Manchester will take place in September.

THE Duke of Devonshire, presiding in his capacity of Mayor of Eastbourne, at a meeting of the Eastbourne Town Council, stated, with reference to the proceedings of the Technical Instruction Committee of the Council, that he had been long aware that the corporation had been anxious to obtain a site for the erection of a building for technical instruction purposes and for a free library. A site had become available on his estate which he would have great pleasure in offering to the corporation as some memorial of his period as mayor of that borough. The value of the site, which would shortly have a double frontage, was estimated to be between £5000 and £5500.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

July 13th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Admiralty has determined to alter its original idea of spending only a few thousand pounds for the erection of a block of buildings at the Royal Naval Hospital, Stonehouse, for the reception of patients afflicted with infectious diseases, and purpose now to spend about £15,000 on this object. A site for the building of the new block has been selected at the southern extremity of the present Naval Hospital, and the work is to be commenced forthwith.

MUCH interest has been excited in Leicester by the discovery of two additional tessellated Roman pavements in one of the most ancient quarters of the borough. They were laid bare at a depth of about 8ft. One measures 13ft. by 10ft., and the other 12ft. by 7ft., and both are in a remarkable state of preservation. Both are of really beautiful design, and in this respect resemble others which had been previously discovered. In the larger portion there is the representation of a peacock with spread tail. It is known that the old Roman forum stood here, and it is accordingly believed that the pavements originally belonged to the Governor's residence or to the Temple of Janus, which was situated in the same neighbourhood. The newly-discovered pavements will be preserved intact in the position in which they have been found.

A VIGOROUS effort is to be made to preserve the old parish church of Great Hampden, a building which, dating from the fourteenth century, and linked so closely with the memory of the patriot Hampden, boasts associations that are well described as of national interest. The bulk of the sum—£440—already subscribed for the purpose of the restoration has already been expended. Hampden house itself is a spot of great historical interest. The earliest part dates from the reign of King John, and one of the features of the forthcoming bazaar will be the exhibition of the brick parlour in which John Hampden was arrested for refusing to pay shipmoney.

AFTER being closed for six months, the church at Stratford-on-Avon is to be reopened to-morrow (Thursday). The Committee which has superintended the work started with the intention of improving the organ, renovating the interior of the nave, and rebuilding the old vestry. These improvements, it was estimated, would cost about £5000. As the amount of money necessary was not obtained, a great deal of the work contemplated was not attempted. The organ has been improved, and a warming apparatus has been introduced. The floor has been relaid, and a portion of the oak benches needed have been provided. The cost of these improvements has amounted to

£3000. The result is that the church will be reopened with only half of the seats provided, without a pulpit, and without a vestry.

THE London County Council, without a single dissentient vote, has agreed to a great Metropolitan improvement, which has been long expected, and has become an absolute necessity for the ease and convenience of our London street traffic. The idea, of course, of a great thoroughfare from North to South is no new one; it was originally suggested, the Daily Telegraph believes, by the Metropolitan Board, and has been two or three times already under the consideration of the Council. But of all the plans submitted, that of Mr. Shaw Lefevre is, without doubt, the finest and most statesmanlike, the most original in design, and the most extensive and far-reaching in execution. Beginning just east of the Holborn Restaurant, in High Holborn, the new street, which is to be a boulevard 100ft. wide, comes in a direct line southward to a point immediately behind St. Mary-le-Strand, where it sweeps right and left into a fine crescent, one end resting on Wellington Street, the other leading directly to the Church of St. Clement Danes. It is no argument against the scheme to say that as much necessity exists for a new thoroughfare from East to West as for this proposed boulevard from North to South. Everyone knows that the difficulties to be encountered are far greater, and, after all, the execution of one design does not in any way exclude the consideration of the other.

THE advantages of the thoroughfare will be quite as much ornamental as material. We shall have from Holborn to the Strand a high road which will stand comparison with the magnificent streets of foreign capitals, while a vast number of rookeries and tortuous slums will be swept away, affording shelter at present to the lowest and most degraded of our urban population. It is worthy of notice that the scheme will leave the Lyceum Theatre in its present site, fronting one end of the new crescent; but the Gaiety, the Globe, and the Olympic are all to disappear, giving room for better and more commodious structures hereafter. On every ground the Council is to be congratulated on the decision at which they have arrived, and if they have shown from time to time a certain slackness in undertaking great and radical improvements in London, they have now nobly redeemed their reputation by consulting alike the comforts and conveniences of traffic and the beauty and dignity of our Metropolis.

SOME interesting additions have been made to the National Art Gallery. Sir Charles Tennant having presented the portrait of Mr. Gladstone by Sir John Millais to the nation, it may now be seen in Room 21 in the English wing of the gallery. The collection of works of the Milanese School, now being exhibited at the Burlington Fine Arts Club, contains a portrait said to be of Francesco Archinto, by Ambrogio de Prodis, and this has been purchased for the national collection, and will be placed in Room 9. Pictures, including a sketch portrait of Lady Hamilton, by George Romney, will be added to the gallery through the will of the late General John Julius Johnstone, and Colonel the Hon. F. W. Stopford has presented a portrait by Romney of Lady Craven, afterwards the Margravine of Anspach. These will be placed in Rooms 18 and 20 of the English wing.

THE Royal Exchange will also receive some important Art additions in the course of the next few months. Three pictures will be added to the three vacant panels, and all are of great historical interest. Mr. Carl Meyer gives a painting by Mr. E. Glatze, depicting the offering of the Crown of England to Richard III. at Baynard's Castle. This gift has been approved by Sir Edward Poynter and Mr. Alma Tadema, R.A. Mr. Stanhope Forbes, A.R.A., is painting a picture representing a scene from the Great Fire of London, and this will be the gift of the Sun Fire Office. The third picture, to be presented by the Mercers'

Company, depicts the opening of the Royal Exchange by Queen Elizabeth, and is being painted by Mr. Ernest Crofts, R.A.

A NEW screen has been erected under the tower arch of St. John Baptist Church, Margate. It is executed in teak, is a very massive erection, one which will, in point of stability, occupy its present position for centuries to come. It consists of a central archway, with an arrangement of traceried work on either side, forming three divisions. The head is a massive piece of timber in one length, the carving on which consists of thornes and bells—the former suggestive of the name of the deceased in whose memory it is erected, and the latter suggestive of the position the screen occupies. The top is surmounted by battlements, cut in the solid. The style of architecture of the screen is Perpendicular. The designs are by Mr. R. Dalby Reeve.

A NEW font cover has also been installed in St. John Baptist Church, Margate. The cover is rather flat in shape. On the top is carved a large cross, entwined with which are lilies of large size, emblematical of purity. The whole is richly moulded, and a border of conventionalised lilies runs round the same.

THE forty-seventh annual meeting of the Birkbeck Building Society was held last week at the offices, 29 and 30, Southampton Buildings, Chancery Lane. The report adopted states that during the financial year just closed the total receipts from all sources, taken with the disbursements, discloses the fact that the annual turnover has amounted to £37,488,736, being a daily average of upwards of £120,000 for every business day that the office has been opened throughout the year. The investments now exceed ten millions—£10,778,675—and the total liabilities on subscriptions and deposits also exceed ten millions; whilst the balance of assets in excess of liabilities amounts to £431,984. The amount received for subscriptions during the year has reached the sum of £266,511. After allowing for withdrawals, the amount standing to the credit of investing members at the close of the year is £888,896, and the balance of deposits to £9,457,794, amounting together to £10,346,691, an increase over the past year of £1,233,236. The investments in convertible securities and the cash in hand have been augmented to the extent of £1,212,079, and now amount to £3,213,785, of which £1,542,652 is invested in Consols and other Government securities, and upwards of two and a half millions—£2,652,483—are inscribed in the books of the Governor and Company of the Bank of England, and £619,206 cash at bankers. The number of members who have joined the Birkbeck during the past year is 2924. In the banking department 2116 current accounts and 7377 deposit accounts have been opened—in all, 12,417 new accounts, being at the rate of 1034 per month. The register of shareholders now contains the names of 13,601 members, and besides these there are 19,160 current accounts and 52,333 deposit accounts, thus making the total of members and depositors 85,094—the highest number ever attained. The number of shares in existence at the close of the year was 69,611, which is also the highest number yet reached. Since its establishment the Society has returned to the shareholders and depositors more than one hundred and ninety-four millions (£194,672,808), the whole amount having been repaid upon demand. The amount advanced to borrowers has been £3,559,256. The amount of interest and bonus paid to investors and depositors is upwards of three millions sterling, the exact figures being £3,322,147, and the invested funds now exceed ten millions sterling—£10,778,675.

THERE is every reason to hope that success may attend the effort which is being made by a group of friends and admirers of Sir Edward Burne-Jones to raise a fund sufficient to secure one of his most representative works for presentation to the National Gallery. No better way of commemorating a great artist could be devised. But it is most desirable that, in

addition to a picture, a really comprehensive set of his sketches and studies should be acquired. One of the most remarkable characteristics of his artistic method was his extraordinary care in preliminaries; and no representation of him would be complete which did not emphasise the almost devotional preparation that preceded his labour on an important work. At the Tate Gallery there are many rooms unsuitable for the display of large pictures which could be most instructively filled with the studies of our greater artists.

THE arrangements for lighting Balmoral Castle by electricity are now being carried into effect, and during H. R. Majesty's recent stay there considerable progress was made with the estate work in connection therewith. Half a mile of iron pipes of large diameter has been laid for bringing the water from the upper portion of the Gelderburn to the site of the turbine house, which is situated near the old sawmill, about a mile and a quarter from the Castle. In some places, ways 12ft. deep had to be blasted through the rock for laying the pipes. Provision is being made for two Gilkes vortex turbines, which, with a fall of nearly 80ft., will give 80 horse-power combined. This power will be utilized in driving the dynamos for charging a large battery of accumulators at the Castle, and also for lighting the lamps direct. The current will be transmitted by large cables laid underground all the way. The electric light will at first be limited to the Queen's private apartments, the ball-room, and a few of the principal rooms in the castle, and the installation is expected to be in working order by the time her Majesty returns to the north next month. Eventually, more than 600 lights will be installed in the castle alone, but if electric lighting is extended to the stables and outbuildings about 1000 lights will be required. The whole of the work, with the exception of fixing the turbines, is being carried out by the commissioners' staff at Balmoral, assisted by some of the household electricians, under the direction of Mr. William Massey, of Twyford.

AN ingenious inventor some years back hit upon the idea of utilising cork as a substitute for wood or asphalt in the paving of our streets. Wood and asphalt are both apt to be slippery in dirty weather; cork, on the other hand, always affords a firm foothold for man and beast alike, and is, comparatively speaking, noiseless. The Improved Cork Paving Company gave practical demonstration of the value of the new material last week at Liverpool Street Station. Here the paving has been tried by the Great Eastern Railway Company for the past six years, with such good results that it is gradually being used in every direction there—no mean testimonial, this, considering the heavy traffic which rolls in and out of the great terminus. The material itself consists of cork ground very small, mixed with a description of bitumen, and put under hydraulic pressure of sixty pounds to the inch. It is claimed for it that, in consequence of its durability, elasticity, and non-absorbent qualities, it makes a perfectly sanitary pavement. There is little doubt that our London horses would give it a decidedly grateful welcome, and wherever it has been tried by various vestries, railway companies, and the like, it appears to have given invariable satisfaction.

MUCH disappointment will be felt by admirers of the Brontës at the utter lack of interest shown by the public at the sale of relics and mementoes of the celebrated sisters, in Sotheby's Rooms, on Saturday week. At first the auctioneer offered the entire collection—comprising 107 items—in one lot, but not a single bid was forthcoming. He accordingly proceeded to deal with the articles separately, and even then the first half-dozen lots could find no purchasers. These were all drawings by Charlotte Brontë, most of them being neglected because they were unsigned. The first lot that actually found a buyer was a simple water-colour of flowers by Charlotte Brontë (signed), which fetched 7s. Nearly a

third of the whole collection failed to elicit any bidding, one of the lots being, curiously enough, the most important item in the catalogue, the portrait in oils of Charlotte Brontë, by J. H. Thompson.

MILLAIS and Burne-Jones have been names to conjure with in the auction-room this season, and on Saturday week at Christie's an endeavour was made to put a little life into a miscellaneous sale by the inclusion of "remaining works" of the former master and the four pictures by Burne-Jones representing the story of Pygmalion. Some of the Millais examples had appeared before at auction last year, and their reappearance showed that the reserve prices had not been exceeded on that occasion. But even the sum of 1700 guineas obtained for "The Ruling Passion" or "The Ornithologist" in 1897 was not approached on Saturday, the picture being announced as falling to Mr. Marshall for 850 guineas. "Time," another of Millais' examples, reached 260 guineas, as against £441 last year. Both these canvases are good specimens of the late President's art, and their failure to maintain their previous prices must be ascribed to the present lackadaisical state of the picture market. The Burne-Jones quartet, entitled "The Heart Desires," "The Hand Refrains," "The Godhead Fires," "The Soul Attains," do not rank among the painter's highest achievements, and when they appeared in the Craven sale, 1895, did not go beyond £3675. On Saturday week the name of the buyer was given as Mr. Seymour for 2800 guineas. The spiritless nature of the sale was further shown in the want of interest caused by the submission of Mr. Stanhope Forbes's "New Calf," exhibited at the Royal Academy two years ago, and the property of Mr. Daniel Delius, of Bradford. After wearily reaching 400 guineas, the picture fell to Mr. Parkins. A certain enthusiasm greeted Corot's "La Chevière," which went at 1600 guineas to Mr. Obach.

UP to the present the City Corporation has taken no part in the agitation that has been set on foot with the object of inducing the London County Council to modify their proposals in reference to fire protection. It is suggested that in every factory a stone staircase should be provided, so as to ensure the safety of the workpeople in the event of a sudden outbreak of fire. That such a precaution should be taken in the case of a warehouse that is about to be built may be very proper, but it seems very hard on the owners or lessees of existing buildings that at a moment's notice they should be called upon to incur the expense attendant upon reconstruction.

A HANDSOME block of buildings, forming a valuable additional wing of the Jews' Free School, in Spitalfields, was opened a week ago. The structure represents an expenditure of close upon £20,000. Designed by Mr. N. S. Joseph, the new wing will add greatly to the accommodation which the school affords. There will be a technical school and a laboratory. The technical school, the use of which is not to be restricted to Jewish children, will, it is contended, be of great use to the latter in preparing them for trades which have hitherto been practically inaccessible to them.

ONE of the largest undertakings in South America since the Panama Canal dissected the Isthmus is the Mexican Canal, which has just been completed by the engineering firm of Sir Weetman Pearson and Sons, of London. The project has found employment for several thousand workmen daily during the past eight years, and it is estimated that the expenditure exceeds 20,000,000 dollars since the contract was allotted to the English firm. The earliest inception of the Mexican Canal is traced by Aztec records to a period which is antecedent by half a century to the discovery of America in 1492 by Christopher Columbus. Lack of pecuniary resources has rendered abortive the previous attempts, and it has remained for the ingenuity of Englishmen to evolve success out of the difficulties of the enterprise. Mr. Colls, who has been controlling the work as chief engineer, says:—"The canal starts

from the San Lazaro Station on the Hidalgo Railway, and encircles the east of the Guadalupe Mountains, flowing through Lake Texcoco into a tunnel $6\frac{1}{2}$ miles long, from which it drains into the Mexican Gulf. The entire length is about forty miles, and it drains the whole Valley of Mexico. It will be of great commercial value to the Valley of Mexico, and tends to make it even more healthy than it is at present. We had over 3000 natives on the excavations, the remainder being Americans and English. The canal is 70ft. deep, and we had to build five aqueducts for the rivers in the valley, four iron railway bridges, and fourteen vehicular bridges. To carry out the work we used five long-shoot bucket-dredgers with an excavating capacity of 18,000 metres of sand and rock a week each, and for the canal dug out 21,000,000 metres. Before the canal was established the lakes in the Valley were always flooding the city, but I think we have remedied that misfortune."

"BEING a keen antiquary, when Roman subjects are concerned," writes a correspondent, "I have been to Uphall in the hope of finding evidence of the camp there proving to be Roman in spite of the unfavourable opinion of Smart Lethieullier. I knew the reason assigned by him, that the area of 48 acres was too large for a Roman camp, to be unfounded, for the normal Roman Consular camp, to hold two legions and the usual complement of allies, was nearly twice that size, as any of your readers may see by referring to the article 'Castræ' in Smith's Roman Antiquities, of which plans are given. I believe the camp at Uphall, which I examined to-day, and of the western end of which, resting on the river Roding, I took a photograph, to be Roman. But it would only have been large enough to hold two Roman legions without the contingent of Socii, who were not generally present in Britain, as far as I know."

By promoting Mr. E. A. Abbey to the rank of Academician, after less than three years' probation as an Associate, the Academy has with great promptitude recognised the claims of this artist to be reckoned among the best historical painters of the day. That Mr. Abbey would be elected was generally regarded as extremely probable. His admirable pictures have during the brief period of his practice as a painter in oils gained for him extraordinary appreciation, both from the public and the members of his profession, and he has taken, almost without a dissenting voice, a place in modern Art which he can scarcely be said to share with anyone else. But even if he had never painted a picture in his life, he would well have earned admission to the Academy by the superlative quality of his work in black and white. As an illustrator he is without a rival, and it is pleasant to think that he should represent on the Academy roll this important branch of Art practice.

THE old Norman castle of Ludgershall once sheltered the Empress Maude when flying from the victorious Stephen, and was visited by King John on his way to Ruynymede in 1215. The manor estate, on which the ruins of the castle are still to be seen, has been sold by auction at Andover by Messrs. Mabbett and Edge. The estate is about 670 acres in extent, and adjoins the War Office lands.

SOME difficulty has been experienced in Swansea during recent years in procuring freehold land for building purposes, but this has now been surmounted. A most eligible estate has been purchased by the Coedsaeson Estate Co. Ltd., of which Mr. H. C. Portsmouth is architect and surveyor. The property comprises an area of about 21 acres, and is situated in the west end of Swansea, overlooking the grounds of Singleton and Parkwern, and commanding magnificent views of Swansea Bay, the Bristol Channel, and the Devon and Somerset coasts. It is proposed to lay out the estate in building plots of suitable dimensions for detached and semi-detached houses, thus securing a nice residential district, and a plan has been prepared which, if carried out, will do much to improve the residential part of Swansea.

MODELLING: ITS RELATION TO SCULPTURE AND THE INDUSTRIAL ARTS.*

BY RICHARD FERRIS.

MODELLING is the beginning of all things in the sculptor's art. For in the plastic and obedient clay, the idea can be thoughtfully conceived and developed with all the loving skill which the artist has at his command. It is in this substance that the sculptor takes form, and expresses, in a tangible reality, the conception that had been floating in his mind. When this has been accomplished, although in such a perishable form, the translation of the model into another and more permanent material is a task which requires rather finely developed mechanical skill than artistic ability. The first efforts in representing form in clay were doubtless made when primitive man, moved by some artistic impulse, traced

WITH RUDE AND UNCULTURED HAND

the shape of some animal or implement of war on the soft, unbaked clay of his cups or domestic vessels. From such early endeavours were developed, through the course of time, the perfection of the Greek sculptors, with their nobly ideal forms, abstracted from all accident and individuality. They did not give the rugged mystery of nature, but sought rather to create an ideal of what they considered nature ought to be, and this ideal once established, was adhered to most rigidly. In another school of sculpture was the work of the early masters of the Renaissance, who did not represent nature in the idealistic form, as used by the Greeks, but rather relied upon suggestiveness and vagueness, and its accompanying naturalism. Their reward was a nearness to natural truth which the Greeks did not dream of. They had no preconceived ideal forms to portray, but could wander at will among the accidental graces and half awkward beauties of real life. The historic development of the art, being

AN OFT TOLD TALE,

the general knowledge of which must be familiar to most of us, I do not intend to review, but rather to confine myself more closely to modelling and its relation to the sculptor's craft and the industrial arts of the present day, and these more particularly in connection with Architecture, the mighty mother of all the arts. Among the public of the present day a very general ignorance prevails regarding the work of a sculptor. The greater mass of the people take for granted that a sculptor is a man who makes statues, and perhaps tombstones, and that possibly the same man who makes the tombstones gets up on a scaffold in front of a building and chisels away, in a haphazard fashion, until he has produced a figure or a piece of ornament such as is finally revealed to view. An instance which came under my notice was that of a gentleman, for whom we were doing some work, calling at the studio accompanied by a friend, who, after looking at the various pieces of work lying about, turned to me with a slightly bewildered air, and remarked that he always thought these things were stamped. We can hardly wonder after all at this state of matters, as it is an art that the public unfortunately care very little about.

THE WORK OF A SCULPTOR

is at the present day divided into various classes, some being engaged in the production of subject pieces of an ideal nature—statues, portrait busts, etc. Others, again, find their principal occupation in decorative work of various kinds, of a more or less commercial nature. And while it follows that, judged as an artist, the author of a grandly idealistic figure composition of pure sculpture stands head and shoulders above his more humble brother in the craft, who principally makes a study of commercial work, still, it by no means follows that the greater includes the less, that is to say, that the author of the masterpiece has seldom made it a part of his studies

to work with a technical knowledge of the requirements of the various decorative arts.

REPRODUCTIONS

from modelled work may be divided into two classes, namely, those which are carved, and, secondly, those which are cast. The first point which I wish to raise is the necessity for the use of models in all carved work, excepting, of course, those in which the work is of a very commonplace or mechanical nature. Many architects believe in this method, and with good reason. It is acknowledged by all that the exigencies of the present day demand a certain division in all labour. Whether the principle is a good one or not, we will not touch on. This principle applies, nowadays at least, to modelling in connection with decorative work. For instance, a man may be a very excellent carver, and yet not be strong in original design; in fact, he need not be, and, as a general rule, is not found competent to design the filling up of a space, except by the use of the more common traditional forms of ornament. A modeller may have this skill; indeed, his training fits him for it; and his material is more suitable for designing in, but may not have the power of arranging the general scheme of decoration of a building. At this juncture the skill of the architect asserts itself, and perhaps without troubling very much about the

MINOR MATTERS OF DETAIL,

having the general masses and proportions of his buildings in his mind as no one else can have, can arrange and carry out to a successful completion a scheme of decoration suitable and appropriate to the class of building he may have on hand. I will touch on the capacities of the modeller's material as a medium of design. Clay, being a most plastic substance, is, in the hands of a skilful workman, a most ready medium of expressing a thought, and demonstrating its artistic effect on whatever the subject on hand may be with great facility. It is most essentially a material to design in, to clothe your thoughts in form, and, if need be, to give most rapid expression to any idea that may occur. I have frequently had experience of work, which had been built up to the rough sketch of the architect, gradually changing in design, and as it continued to develop each rough mass and corresponding shadow would suggest some new and better conception of its finality. There can be no doubt that here we have the best way whereby studied design and harmonious treatment can be obtained. Because in a plastic substance, such as this, we have an opportunity of altering, experimenting, trying this, that, or the other form, and composition of line, of indulging in

LITTLE QUIANT CONCEITS

that occur almost accidentally, and gradually developing the design until it is satisfactory to all interested in the same. The reason for arriving at this conclusion is, that in modelling there is brought into operation an exactly opposite process to that of carving. In modelling we have a building-up with every facility for change. Whereas in carving there is a cutting out with one alternative. A carver working direct into his material without the aid of a model must begin with a fixed idea as to what he is going to make and when it is produced there it must remain without any opportunity for alteration, except in a very minor degree, which will very little affect the general appearance and proportion of the whole. A modeller, on the other hand, often begins his operations with but a hazy idea in his mind of what the design will ultimately become, excepting the knowledge that it will be treated as a figure composition or a piece of ornament, and in either circumstance, with the style and general instructions he may have received well in his mind, and as the work of building up proceeds, the perfectness of the idea or conception of the subject grows gradually till the finishing point is reached. During the course of the

MANIPULATION OF THE CLAY,

ideas do and will suggest themselves, thus providing the opportunity, if desired, for the

original scheme to be elaborated, and carefully thought over until the design is finally evolved in perfect fulness. As I have said, a carver in either wood or stone commences his operations in his hard material, working probably from a carefully executed drawing, which, as a rule, is adhered to in the most rigid manner. And here I would submit for your consideration the fact that a drawing, even made by a most skilful draughtsman, must and does always, in a certain degree, come short in the expression of the subject's finality, and more especially is this the case in relation to carved work. No matter how well it may be executed, a drawing will sometimes fail in expressing to the carver the exact meaning the designer may have had in his mind. I remember an architect telling of an experience which he had of a carver totally misunderstanding his intention. The architect in question intended to use two capitals, each of different design, and with this purpose made a drawing showing two half capitals, each being different. When he called to see the work he was astonished to find that the carver had, in an ingenious fashion, utilised the

TWO DESIGNS IN ONE CAPITAL,

one design on the left-hand side of the centre line and the other on the right. This, of course, is a very extreme case, and rather comical than otherwise. But without going the length of a mistake of this kind, I hold that a drawing will fall short of the influence and distinctness of impression conveyed to and made on the carver's mind of every detail connected with his subject when working in the presence of a model. The same before passing from the modeller's hands, having given every indication of completeness to the mind in which was formed the original conception of the idea. Nevertheless, do not misunderstand me. I by no means have an objection to a drawing. It holds the most important place in connection with the industrial arts, and is the only way by which a designer can communicate his ideas to the craftsman. The contention is rather on the place assigned to the drawing—in its place, if I may so speak, between the draughtsman and the permanent material. Therefore, we cannot but conclude that before a design is carved in stone, wood, or marble, it certainly ought to be tried in a plastic material, if only for the sake of experiment. Hereby all the best parts of the design can be manifested, there the lights and shades are observed, and

THE MOST DELICATE DETAILS

can be expressed in an adequate manner when the design is produced in such a materialistic form as is afforded by modelling. By this means we have the additional advantage of two minds working together on the same idea, the author guiding and directing the modeller, and the criticism coming perhaps from both, which must all tend to the final production of more perfect work. Taking into consideration the arguments I have used, I would urge upon all interested the necessity of using models on all occasions where carved work is required. By this means there is no doubt better results will be obtained. The idea worked out primarily in the clay cannot fail to give a greater degree of satisfaction to those interested in the final production. We take a craftsman out of his sphere when we request a carver to produce a work of art right off in a hard substance without the aid of a model. Such a request involves considerable risk in the production, as from the first click of his mallet and chisel to the last finishing touch there is permanency to his work. There is very little scope for alteration, or opportunity for improvement, should even the idea suggest itself during the process; the material is chiselled away, and there it must remain, for good or bad. The point is that in all such work an opportunity ought to be afforded for

THE PLAY OF THE IMAGINATION

on the subject in a less stubborn material than stone or wood. It is at this juncture when modelling steps in, and gives to the author of the design all the advantages I have named, and to the carver a reliable model to work by, and which, when produced in stone

* A paper read before the Glasgow Architectural Association.

or wood, affords less risk of disappointment. Another point to consider is the actual economy of this method of working, as by this means the carver is enabled to proceed more rapidly with his work, cutting direct into the stone without hesitation, so that the small amount expended on the model is fully repaid by the more rapid execution in stone. To enumerate the various crafts which derive assistance from the modeller would be nearly impossible. I have modelled in my own experience every conceivable material, from the most delicate work for the gold and silversmith to the pattern for a humble cake of chocolate. The training and

TUITION OF A MODELLER

ought to be such as would enable him to work with confidence in such a manner as would suit the technical requirements of the various materials for which he may be called upon to make models for. It is obvious that the style of ornament or treatment which might be very beautiful when completed in marble would have comparatively little effect were it produced in cast-iron. The same judgment and discrimination must be brought into use in considering the suitability of a design for the position it is intended to occupy and the point of view from which it has to be seen. For instance, the delicacy of treatment and amount of detail which might be used with good effect on a frieze intended for the decoration of a drawing-room, would be entirely lost, and worse than useless, if used on a stone frieze on the exterior of a building 50ft. or 60ft. above the ground. A great point to consider is the design from a utilitarian point of view—that is to say, that it shall be designed to exactly suit the technical requirements of the material in which it will finally be produced, and to endeavour to

DECORATE IN THE MOST APPROPRIATE MANNER

the object or building destined for its reception. Sir Edward Poynter gives an example, in one of his lectures on Art, of a most inappropriate kind of decoration, which illustrates the present point so well that I might be excused if I give it here in a condensed form. Mr. Poynter goes on to say, "that a bunch of roses or a lapdog painted in a slovenly way on the black japan of a coal-scuttle is as inappropriate a piece of decoration as ever was devised, and would spoil, instead of improving, the best contrived coal-scuttle." It is not difficult to trace the source of this particularly bad form of decoration; it arises entirely from a vulgar feeling, hidden in the depths of our hearts, that there is something rather commonplace in a coal-scuttle, which makes it suitable enough for a kitchen but out of place in a drawing-room, hence the introduction of the roses and lapdog, varied occasionally by a picture of a church by moonlight, was considered to give great elegance to what otherwise would be rather an objectionable piece of furniture. While this illustration of Mr. Poynter's is

FROM THE PICTORIAL POINT OF VIEW,

there are many examples of as incongruous design of a sculptural nature. For instance, I have noticed a truss, presumably supporting a heavy weight, made up entirely of foliage, flowers, and birds, not used in conventional forms but treated in a naturalistic manner; the error being, that instead of decorating the truss or corbel with foliage, which would be quite good in its way, that the support was composed entirely of ornament, and no attempt made to give a structural form which would at least have the appearance of being able to carry a weight. But I think, gentlemen, you will agree with me in saying that we have arrived at a time in which there is comparatively little of this incongruous design shown in our buildings or articles of furniture, and that we are striving after a stronger and more appropriate style of decoration, a change for the better which the younger school of draughtsman in Glasgow have been by no means backward in making their mark. To come to those materials which are reproduced from modelled work by the operation of casting, within the range of which are included the various metals, plaster,

and terra-cotta, it is worthy of note here the comparative scarcity of terra-cotta used in Scotland as a building or decorative material. I am aware that this is a stone country, and that it is by no means rich in deposits of finely coloured clays, and as a natural consequence our potters are

HARDLY CAPABLE OF TURNING OUT ARCHITECTURAL WORK.

Indeed, it is a matter of difficulty to get a small piece of original work fired, a process which in Glasgow, at least, is generally attended with no small risk. Personally I have been very fortunate in experiences of this kind, as out of a large number of works I have had fired, I think, only one piece was injured. I feel rather strongly in this matter, as it is the only way that a model in clay, without going through the operation of casting, can be made permanent and unperishable, and the result when successful is very beautiful, every touch being retained with a degree of perfection which the finest casting can never have. The durability of terra-cotta is unquestioned; the relics of past ages prove it beyond a doubt; and that fact being established, we will look briefly at its artistic qualities, which cannot be over-estimated. I can imagine no finer form of decoration, especially for a country house, even used in combination with stone, than

TERRA-COTTA,

used in a judicious way. There is the variety of colour that can be obtained from various clays which can be used with most harmonious effect in relation to the general colour scheme of the building. I would suggest, in order to get the best results from decorative work in terra-cotta, that the original be used in position on the building—reproductions of course are easily made if desired, but even the operation of casting requires a certain amount of filling up and consequent loss of undercutting, which will to some extent rob the castings of a little of the spirit and freshness which is so typical of original modelled work; in fact, a dashing and vigorous effect can be got in clay, which cannot be equalled by any carving, however excellent. I have mentioned the difficulties that at present attend the production of work of this kind; but I think if it was encouraged in a slight degree, the means would speedily be found to overcome these difficulties. Now as regards the relation of modelling to

DECORATIVE WORK IN PLASTER.

This material possesses exceptional properties for the faithful reproduction of modelled work, the variety of materials which can be used to make the necessary moulds being of such a nature that any difficulty which may arise can be successfully met. As a general rule, moulds made of wax are found to have sufficiently elastic properties to allow the cast to be taken out with ease. And in the case of highly-relieved and undercut work, moulds made of gelatine entirely obviate the necessity of filling up the shadows, and allow the cast to retain, in a great degree, the artistic roughness and spirit of the original. The materials I have mentioned are those which are in common use in everyday work, but, besides these, plaster makes for some purposes the most perfect mould that can be devised; for instance, the casting of purely architectural forms, whose beauty consists in the straightness and sharpness which properly belong to them. The process of what is technically called

"PIECE MOULDING"

is used, which might be shortly described in making the mould in such sections as the nature of the work may demand. These pieces which fit most accurately together are confined in a case, "also made of plaster," which entirely prevents any such mischance as the various pieces getting out of position. Exactly the same process applies to the casting of figures or busts. Besides these, sulphur is used occasionally for particularly fine work such as casts of coins, &c., but, as it is rarely used in the production of ornament for architectural work, we need not dwell upon it here. Generally speaking, ornamental plaster work

has improved considerably within late years, and has made rapid progress towards a greater perfection from an artistic point of view. The study of old Scotch plaster work is an interesting one, which must be familiar to most of us here. There one meets with a variety of ingenious design, the results of much patient labour, and generally modelled in position by the hand. When we consider the beauty of that old work in existence in our own country, we wonder how so great

A CHANGE FOR THE WORSE

could have taken place, and passed into the vulgar and ugly character of work which prevailed not very many years ago, with its heavily relieved cornice, and huge centre flower weighing somewhere about 2cwt. or 3cwt., which seemed to possess the unfortunate knack of dropping and bringing half the ceiling with it, usually on the most unwonted occasions. Happily, we have to say that all this has undergone a change for the better; we have now a lighter and more artistic style of decoration. Much has been achieved in this direction by the aid of fibrous plaster friezes; parts of ceilings, and enrichments of all kinds, can now be cast of considerable dimensions, and at the same time possess such a remarkable degree of lightness that renders fibrous plaster one of the handiest materials to work with. And, to complete more thoroughly the work, these pieces are screwed to the ceilings or walls as their respective requirements demand. Thus you will at once perceive it is self-evident from the foregoing remarks that the securing of the work being well done effectively prevents the possibility of the

DISASTER OF A FALLEN CEILING.

While speaking of the advantages of fibrous plaster, I hope you will understand that I by no means cast any disparagement on the ordinary style of plaster-work: on the contrary, there are many designs which are more practically fitted to be carried out in the old way than the new. And in some cases a combination of both will be found to be the most suitable from a technical point of view. For instance, in a room, intended to be finished with a large frieze and small plain cornice, it would very probably be found that the operation which would give the best results would be to run the cornice in the ordinary way, and cast the frieze in fibrous plaster for securing it in position. But as so much depends on the character of the work to be done, as to the best method of doing it, that it would be impossible to lay down any hard and fast rule for the best way of executing decorative work in plaster. I have reviewed in a slight manner the crafts with which I am most familiar in connection with the decoration of architectural work, and advocated the use of models in carving. In cast work the use of modelling goes without saying, as it is the usual way of preparing the original, from which any number of impressions may be taken. To set the subject before you as clearly as possible I will now show some views on the screen, which will bring before your notice in a more graphic manner the connection of modelling with sculpture and the applied arts.

New lodgings have just been provided for the Judges of Assize at Winchester by the county of Hampshire. They are comfortable quarters in one of the old prebendal houses in the Close, just opposite to the ancient Priory Hall. The house in question has been used for some years for clerical meetings, and for the Cathedral choir school, and it was previously the residence of Sir Walter Crofton, and of Mrs. Lyall.

At a recent sale at Christie's a miniature of Hannah Beresford, a daughter of the Right Hon. John Beresford, when young, seated in a landscape, brought 94 guineas, and another of her sister, Frances Honoria, 130 guineas. "Mrs. Pelham Feeding Chickens," an engraving with untrimmed margins, after Sir J. Reynolds, by W. Dickinson, was knocked down for £446 5s., while "The Months," a set of twelve coloured prints, after W. Hamilton. R.A., by Bartolozzi, sold well for £80.

Professional Items.

ABERDEEN.—A new bridge is to be erected across the Ythan at Lewes of Fyvie. The old, narrow, hump-backed bridge which has formed an interesting landmark is to disappear. The old bridge had only 10ft. of width of roadway in the centre, which was considerably raised above the level of the road at each end, after the type of so many of the bridges built throughout Scotland during the last century. The plans of the new bridge have been prepared by Mr. John D. Watson, county engineer, and the contract has been secured by Mr. James Ferguson, Bogtama, Fyvie. The length of the bridge from roadway to roadway will be 63ft., with a clear width of 20ft., or double that of the old bridge. There will be two spans of 23ft. 3in. each, with a centre pier 4½ft. thick, as compared with 11ft. in the old pier. The bridge is to be built of rustic-faced freestone throughout, with concrete foundations.

ARBROATH.—It is proposed to erect a new fishermen's hall at Arbroath. The plans show a basement floor, a ground floor, and a gallery. The basement has been acquired by the ground inside the feu being at a lower level than the street, and in it are shown performers' rooms, a heating chamber, a store, and two reception rooms. On the ground floor plan are a porch, a vestibule with stairs leading to the basement and to the gallery and the hall.

BALMORAL.—In Crathie Church the unveiling of a Jubilee commemoration window took place a day or two ago. The new window is the work of Messrs. Clayton and Bell, Regent Street, London. The window is placed in the north transept, immediately opposite the Royal pew, which is situated in the south transept. It consists of three lancet lights, the centre one being the larger. The middle light, which comprises the main feature of the design, contains a representation of King David seated on a throne and bearing a golden harp. The right-hand light has a figure representing Miriam, the sister of Moses, bearing cymbals.

BIRMINGHAM.—The ceremony of laying memorial stones of a new Welsh chapel in Suffolk Street, Birmingham, was recently performed. The chapel, which was designed by Messrs. Ingall and Son, and is being built by Mr. John Bowen, will accommodate just over 200 persons; and behind the principal building there will be a meeting house and a residence.

BRIXTON, S.W.—The large establishment known as the Brixton Bon Marché has recently been considerably extended, and the contract for the electric light wiring of the whole building has been entrusted to Messrs. Geipel and Lange, to be carried out to the specification of Mr. Albion Snell with Andrews' Patent Concentric Wiring.

DEWSBURY.—There is a good deal of activity in the building trades at Dewsbury. Several villas are being erected on the Carrett or Nothfield estate, a new wing is being added to the Dewsbury and District Technical School, the frontage being to Carlton, and the London and Yorkshire Banking Company are getting out the foundations for new and handsome premises in Northgate, and similar work is being done in New Bridge Street for shops and offices. Tenders are invited for the construction of an arcade from that thoroughfare to the north side of the Market Place, and a fine terrace has been built nearly opposite the south gate of the Dewsbury Public Park. In addition, the Masonic Temple in Halifax Road is to be enlarged, and there is reason to believe that sanction will be given to the erection of a hospital at Mitchell Lathes for the reception of infectious cases. The new building inspector at Dewsbury is Mr. J. E. Fothergill, of Batley.

EASINGWOLD, YORKS.—The whole of the work in connection with the restoration of the Catholic Church of St. John the Evangelist,

Easingwold, including new roof, new stone buttresses, new porch to west entrance, &c., has been entrusted to Mr. Anthony Lyons, builder, of Norton, Malton.

ECCLES.—The Local Government Board has given its consent to the Eccles Corporation borrowing the sum of £1640 for the improvement and extension of the public baths in Milton Street, Patricroft. These works, which are nearing completion, consist of the erection of a new boiler-house and boiler, laundry, and the improvement of the existing baths.

FORFAR.—It is proposed to erect a new organ in Forfar Parish Church. The organ has been designed by Messrs. Forster and Andrews, of Hull, and is to be made throughout of the best materials. The bellows action is to be on a new principle, and wind is supplied by two hydraulic engines, with suitable blowing apparatus and starting and stopping gear. The sound board, upper boards, tables, and squares are made of Honduras mahogany, and the sliders of oak. The case-work of the instrument is of pitch or yellow pine, the front pipes to be decorated in gold and colours. The instrument is to occupy a position on the north side of the church, facing the pulpit, and large structural alterations on the building have to be made to make way for it. Almost the whole of the north wall of the church will require to be removed and a new wall erected. The gallery will also be taken down, and two new galleries built on the east and west sides of the church respectively, in order to leave an open space in front of the organ.

LEAMINGTON.—The Mayor of Leamington has laid the corner-stone of the new nave and bell tower of the Leamington Parish Church. When the work, for which Sir Arthur Blomfield is the architect, is completed, the nave will be about twice its present length, and the seating accommodation will be considerably increased. The new tower, in which it is intended to place the peal of six bells, which have been without a home since the wooden belfry was removed in 1833, will stand at the south-west angle of the church. It will be an imposing structure, with a total height of 143ft. to the top of the pinnacles. It is proposed to build a light lantern, of the Peterborough pattern, over the crossing of the nave and transepts, where sixty years ago it was intended to place a tower and spire. It is estimated that the whole work of restoring and completing the church will cost £15,000. The church, when completed, will undoubtedly be of very fine architectural proportions.

LEEDS.—At a recent meeting of the Highways Committee of the Leeds Corporation, tenders to the extent of £13,923 18s. 10d. were accepted in connection with the extension of the electric tramway system to Headingley, Chapeltown, and Hunslet. The Corporation had invited tenders for the supply of two engines and dynamos of about 1000-horse power, and for fifty new electric cars, which, it is anticipated, will be in use on the routes mentioned early next year. The committee accepted the tender of Messrs. Greenwood and Batley, of Leeds, for the engines and dynamos at the sum of £15,586; that of Messrs. Dick, Kerr, and Co., of Glasgow, for the fifty cars at £468 10s. each; and that of Mr. Isaac Gould, of Leeds, for the work in connection with the extension of the generating station at Crown Point at £4082 15s., that sum including everything except smith's and founder's work, which has been let to Messrs. Clayton, Son, and Co. Limited, Hunslet, at £830 3s. 10d.

LIVERPOOL.—A scheme for rebuilding the whole of the Royal Institute is to be carried out. Competitive plans have been invited for buildings to take the place of the present ones on the west side of Colquitt Street, and to be erected in sections as funds are obtained. The first portion to be proceeded with is that of erecting a lecture hall capable of seating 1250 people, at a cost not exceeding £7000.

The new offices built for the Liverpool School Board in Sir Thomas Street have recently been

opened. The building, architecturally one of the handsomest in the city, has been designed by Mr. Charles E. Deacon, architect, Liverpool. The style is a free treatment of English Renaissance. The building consists of a basement, ground floor, first, second, and third floors. The main staircase is situated in the centre of the building, and is lighted from an inner court by means of windows, which have been filled by ornamental stained glass. Space is enclosed for two hydraulic lifts. The principal rooms are on the second floor, where through an ante-room access is obtained on the right hand side to an apartment intended for the meetings of committees, and on the left to the board room. The committee room and board room are unusually lofty, the ceilings being raised by a mezzanine above the third floor. All these apartments have been richly panelled with teak. The walls above the panelling are decorated with embossed leather, and the ceilings and cornices are of rich design carried out in fibrous plaster. On the same floor, but to the right of the staircase, a short corridor leads to a large and handsomely fitted up apartment for the use of the chairman, clerk to the board, &c., with ante-room adjoining. This apartment is lighted by three bow windows looking on to the inner court. On the opposite side of the court, which is faced with white glazed brick, are cloakrooms and lavatories. The first floor is occupied by spacious and well-lighted general offices, and by the offices of the School Management Committee. On the ground floor are the offices of the school attendance department, with ample waiting-room accommodation. The basement will be occupied in part by a dining room for the employees and staff, the kitchen arrangements, &c., being of the most modern pattern. The building will be lighted throughout by electricity. The ventilating, lavatory, and other arrangements are of the most approved type. The cost of the building was £20,455, and the total outlay, inclusive of furniture, will be about £25,000.

MORECAMBE.—The introduction of electric light on the front at Morecambe has proved very satisfactory. At present there are fifty-five arc lamps in operation, extending from East View to the West End Pier. The cost of the undertaking is estimated at £40,000. Another step has been taken in the development of the town in the opening of the new Warwick Revolving Tower, erected at the West End. In design, the tower is hexagonal, being built with steel girders, braced with steel angle bars and cross tie rods, and having a height of 155ft. The passenger car, which travels 120ft. high, revolves as it ascends and descends. The car will accommodate 200 persons, and the structure is firmly secured to a very massive concrete foundation, weighing upwards of 300 tons.

NEWPORT.—The new Church of St. John the Baptist at Newport is in the Risca Road, and will accommodate about 700 persons. The present contract, which has been taken by Mr. W. A. Linton, of Chepstow Road, Newport, is for the erection of the nave, north and south aisles, south porch, chancel, south chancel aisle, north chancel aisle as an organ-chamber, a sacristy on the same floor as the church, and a large vestry, a store and heating chamber in the basement, with stairs leading up to the north chancel aisle. This will complete the church, with the exception of the west tower, which is contemplated, but the designs for this have not been elaborated yet. The style of work is of the Devon and Western Counties type of late Gothic. The material is red Risca walling with Bath stone drapings. The floors for the most part are to be of wood block, but the chancel floor will be in Mosaic. The roof will be covered with grey slate. The design is intended to be greatly enriched as regards the interior from time to time as funds will allow. It is hoped that the screen, the altar pieces, the pulpit and chancel fittings will eventually be of elaborate woodwork, and that many of the windows may be filled with painted glass of the best description, a scheme having been proposed for the treatment of every window in the church, so that there may

be a proper fitness in the whole conception and treatment. The designs are by Mr. F. R. Kempson, of Cardiff and Hereford.

OTLEY.—The new premises of the Yorkshire Banking Company Limited, in Kirkgate, Otley, which were recently opened for business, are admitted to be one of the handsomest piles of banking premises in the Riding. The new premises have been built from plans prepared by Mr. Marshall, architect, Otley. They occupy a commanding position near the corner of Kirkgate and Westgate, with a frontage of 30ft. The style is perhaps more akin to the Renaissance than any other. The outer walls are of stone obtained from the Clayton Quarries, near Bradford, the hardest stone to be found in the county; the inner walls are all of brick. The vestibule or lobby is paved with mosaic, and from this an entry is obtained to the business part of the bank, a commodious room 23ft. by 26ft., and 14ft. high, furnished with Spanish mahogany counter and desks and various other office requisites. A dado of Spanish mahogany runs all round the apartment, and on the wall facing the door there is a handsome mahogany mantel and overmantel. The contractors are: masonry, Mr. W. Maston, Otley; joinery, Messrs. Ives and Co., Shipley; plumbing, Messrs. Suttle and Co., Otley; plasterers, Messrs. Chaffer, Otley; slaters, Messrs. Watson and Worsnop, Leeds; painting, Messrs. Graham, Otley; wood-block flooring, Messrs. Nightingale and Co., Grimsby; strong room door, Messrs. Milner, Leeds; fibrous plaster, Mr. Home, Idle; ironfounders, Messrs. W. E. Turner and Co., Otley and Harrogate; art metal work, Mr. J. W. Longfield, Otley; carving, Mr. Huddleston, Otley; furniture fittings, Mr. Hodgson, Northallerton; mosaic, Leeds Art Pottery Company.

PENARTH.—The spacious schools erected by the Penarth School Board were opened last week. The school has been built to provide accommodation for 780, and is on two floors. The ground will be occupied by infants, and the upper floor by boys and girls. There are six class rooms, and in addition a large cookery room with scullery, and also a room for the use of the Board. The upper floor is somewhat different. Here an assembly hall is arranged, occupying a central position, and measuring 53ft. by 28ft. The school is heated by hot water on the low-pressure system. This portion of the work has been carried out by Messrs. John Williams and Sons, Cardiff. Two large playsheds are arranged in the playgrounds. The architect of the building is Mr. J. H. Phillips, St. John's Chambers, Cardiff. The builder is Mr. John Jones, of Penarth. The amount of contract was £7375.

PRESCOT.—The new infirmary buildings which have been erected by the Prescott Board of Guardians on land adjoining the workhouse at Whiston have just been opened. The new buildings have been erected from plans prepared by Mr. James Gandy, architect, St. Helens, at a cost of about £20,000. The contract for the work was secured by Mr. Fred Brown, of St. Helens. Accommodation is provided for about 300 beds, arranged in thirties, on each of the ten floors. The buildings are of simple brick, and comprise two large blocks of three stories, and two blocks of two stories each; and are fitted internally with all the most modern appliances, including fireproof floors throughout, fire-escape landings, &c.

ROTHERHAM.—A new children's ward at the hospital has been declared open. Mr. J. D. Webster, of Sheffield, is the architect, and Messrs. Chadwick and Co., of Rotherham, are the contractors. The "Queen's Ward" is a handsome addition to the hospital. The bath rooms and sanitary blocks are fitted up with the most modern sanitary appliances, which have been supplied by Messrs. Dent and Hellyer. In addition to the large ward there is a small isolation ward for two beds, fitted with bath rooms. The cubic space allowed to each bed is about 1200ft. The walls of the wards are lined with Burmantoft faience up to the height of 5ft., and above that the walls are painted Parian cement. The large ward is

heated by a central stove in addition to hot-water pipes. In the small ward there is a fireplace and also pipes. The building has been erected and arranged in consonance with the most modern and advanced ideas of hospital construction. The floors are all laid with trazzo, a species of Italian mosaic.

ST. HELENS (Lancs.).—Sir David Gamble has laid the foundation stone of a new mission school-church that is being erected in Knowsley Road. The chief feature of the building will be a large room, 60ft. square, with chancel for services, and for school purposes this room will be divided by folding partitions. The building will be constructed of the best pressed bricks, with red stone dressings, in the Gothic style of Architecture, at an estimated cost of £3189. The contractor is Mr. Fred Brown, and the architect Mr. G. S. Packer, of Southport.

SOUTHPORT.—The Victoria Wesleyan Chapel, Blowick, Southport, was opened a few days ago. The cost of the building has been £4700. The seats in the new chapel are in amphitheatre form, and the building presents other locally novel features. The architects were Messrs. Green and Brocklebank, of Liverpool.

TRON.—Two compartments of a three-light window under the south gallery of the Tron Church have just been filled with stained glass. In the central light is represented a figure of Moses, bearing the two tables of stone and the rod. The light to the left side represents the figure of David, with one hand resting on the harp, and the other holding a scroll. The figures are placed underneath ornaments of an architectural character. The windows were designed and executed by Messrs. Ballantine and Gardiner, Edinburgh.

YORK.—An entire wing has been added to the Royal Station Hotel, York. This when completed will include a new reading room and writing room on the ground floor, a private dining room and reception room on the first floor, and about twenty-four additional bedrooms. The reading room is a magnificent department. The room is approached through a vestibule at the end of the corridor in the present building. This vestibule will form a pleasant and convenient lounge, being furnished with comfortable divans and chairs, and is lighted by two handsome stained glass windows. The reading room is entered by a pair of folding doors under a handsome entablature flanked by fluted Corinthian columns, and the interior presents a rich and harmonious effect, the whole of the woodwork, including the ceiling and floor, being constructed of solid oak. The ceiling is divided into panels by heavy beams, richly moulded, and again sub-divided into smaller panels by moulded ribs having an oak cornice and frieze enriched by triglyphs. The walls are panelled to a height of over 9ft., and the panelling is surmounted by a carved frieze in Acanthus scroll work. There are two lofty fireplaces at either end of the apartment with richly carved entablatures, and panels bearing the arms and initials of the North-Eastern Railway Company. These are supported on carved Corinthian columns similar to those flanking the entrance. The fireplaces are lined with red bricks, which set off the canopied dog stoves, and give an air of comfort and warmth to the room. The upper portion of the walls is hung with a very bold design in Cordelova, executed in high relief, and painted and gilded in soft green and brown tints. The style of architecture adopted is that prevailing in England in the beginning of the eighteenth century, somewhat severe and classical, and harmonizes well with the exterior of the building, while at the same time it offers free scope for playful treatment in the enrichments. The execution of the work has been entrusted to Messrs. Robson and Sons, of Newcastle-upon-Tyne. The electric fittings have been supplied by Messrs. Veritys, Limited, of Regent Street, London, and the stained glass has been executed by Mr. G. G. Baguley, of Newcastle-upon-Tyne.

Views and Reviews.

THE KROMSKÖP.

The pamphlet which booms this invention is issued by the Photo-Chromoscope Syndicate Limited. The writer of this brief notice was asked some time ago to examine a number of photographs produced by the passage of light through this instrument, and to judge for himself whether the colours were Nature's own. As to this the answer must be that they appear to be as true as could be expected, considering that light conveyed to the plate through a complex of lenses is not the light of day, and that the absolute stillness of apparently paralysed nature-forms is hardly conducive to pleasure. What one learns is another matter. It is as different from it in fact as the arc-light on any other illuminant obtained artificially. Take for instance, a bowl of flowers. Look first at that; then into the box where the photograph is, and it will be perceived that they look like death-stricken things. The illusion may be complete at the moment, but disillusion follows as quickly as it does in a wax-work show. It may fairly be said of the Krömsköp that it does for the coloured object what the phonograph does for the voice—it preserves and reproduces it "with a difference," as Ophelia said. The "vast" which severs the quick and the dead is great and impassable, but, granted the difference, the instrument, as a mere recorder of facts, may be declared to be an important invention. This constitutes its claim to respect, and explains its worth in the eyes of the company promoter. It should be explained that we cannot get prints from the negatives, as in the case of uncoloured photographs. If you have not the thing yourself, you must make the said negatives part of your luggage, and take them home to some institution where the photographer's plant is established. The company in question may be advised to take a hint from the spectacle makers, and have the Krömsköp on show in the railway stations alongside of the sight-testing things. The inventor is probably not far wrong in supposing that he has facilitated the acquisition and retention of useful information in more ways than can be enumerated within the limits of a printed discourse.

"WORKSHOP MAKESHIFTS."

This is a useful little handbook for the amateur mechanic of limited means, and as a present for an intelligent and ingenious youth should prove a source of unfailing pleasure and information. The author, dealing with his subject from the standpoint of an experienced and sympathetic friend, "who has been thro' it all you know," and pre-supposing on the part of his pupils some knowledge of the manipulation of what he, in common with not a few people who should know better, term carpenter's tools, but which are in reality joiner's, describes in detail and with copious illustrations the manufacture of a lathe with overhead motion, screw-cutting circular, and fret-saw attachments, from the odds and ends to be picked up in any well-regulated household, such as disused stair-rod, cotton-reels, gas-pipe, &c. Very full instructions are given for the making of sundry tools and contrivances, some of which would probably bring a smile of derision to the face of the professional mechanic, but which will be undoubtedly welcome to the amateur, who not unfrequently is pulled up short in the realisation of his conceptions by the want of some expensive tool. A good table of tempering colours for steel tools is given with instructions for hardening and tempering, and also one of alloys and their melting points. The author mentions also where second-hand tools may be picked up cheaply, but confines himself to one neighbourhood. He might well have added that the same dealers could be met with on other days in Lisson Grove, W., Battersea Park Road, S.W., Farringdon Road, E.C., Mile End Road, E. Occasionally, we think, he rides this hobby too hard—to wit, to buy a rusty old chisel for a penny, and spend

three or four hours in converting it into a presentable makeshift for a new one, which may be purchased for fourpence-halfpenny; this is scarcely an economical proceeding, even for an amateur. The chapter on General Tips, however, is well worth the price of the book. The author, who has a holy horror of that bane of an amateur's existence, the female relative, who, prone to make surreptitious and predatory incursions upon his domain, confiscating his laboriously-produced fillets and frets for meat skewers or firewood! or trying original experiments of her own upon his well-sharpened axe or plane, trying alike to the temper of the tool and its owner, herein gives divers ways to circumvent the enemy that will be highly appreciated by his readers. The mechanical saw-setter, illustrated in the chapter on saw sharpening, is well worthy the attention of the professional craftsman as a cheap and easily-made time-saving tool. We conclude our remarks upon this interesting handbook by pointing out one little piece of bad advice the author gives, and which he will doubtless correct in the next edition—viz., "To place the bench planes upon their sides when not in use." No tradesman would dream of doing this, as the position is both dangerous to the user or passer-by, and injurious to the tool, causing the working face to cast or twist. A clean, smooth place at the front end of the bench-top should always be reserved for the planes, and they should be placed there, upon their soles, when not in use.

"Workshop Makeshifts." By Hans J. S. Cassal. Price 2s. 6d. L. Upcott Gill, 170, Strand.

WILLIS'S WORKMEN'S COMPENSATION ACT, 1897.

The third edition of this little book appears most opportunely just at the moment when the Act which it annotates and elucidates comes into force, and the fact of its having already reached its third edition is ample evidence that it was needed. The Act itself is a short one, but it has to be read as being supplementary to other existing Acts, and in some cases alternative to them, so that cross references are necessary, as well as a most careful weighing of the verbiage in all the Acts concerned before the position brought about by the new regulations can be fully understood. To this end Mr. Willis's exhaustive series of notes will materially assist, for they have evidently been compiled with great care, and are arranged with considerable literary skill, clearly, and intelligently. If we venture to criticise at all, it is to suggest that the actual text of the Act would have been better printed in some more distinctive type, such as small De Vinne or large italics, and to complain of a little, perhaps unavoidable, repetition. Builders who are affected by the Act when their workmen are employed on buildings over 30ft. in height, "and is either being constructed or repaired by means of a scaffolding, or being demolished, or on which machinery driven by steam, water, or other mechanical power is being used for the purpose of the construction, repair, or demolition thereof"—and this includes all builders—should certainly obtain the book, and both study it carefully and keep it for reference in case of need.

THE LONDON MANUAL.

This year's issue of this publication contains sketches by Alfred Parsons, Joseph Pennell, and Herbert Railton, but they are by no means finished works of art, and are too few and far between to warrant the publishers making such a feature of them. The printing of the half-tone photo-engraved blocks might have been considerably improved, but, apart from pictorial pretensions, the information is clearly stated, and makes a useful reference book of 342 pages for anyone requiring information on the various public authorities governing the metropolis, with interesting descriptions of their buildings, works, and methods. The London Manual covers the period of the municipal year from March, 1898, to March, 1899.

"The London Manual for 1898-99," edited by Robert Donald. London: Edward Lloyd, Limited. Price 1s. and 1s. 6d.

Under Discussion.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.

The annual excursion took place on Saturday week at Glendalough. A large number of the members joined, amongst those present being the president, Mr. I. Howard Pentland, R.H.A., Messrs. Walter G. Dooly, Thos. F. Slevin, R. Caulfield Orpen, G. Sheridan, A.R.I.B., Anthony Scott, M.S.A., and R. U. Butler, hon. secretary. The ruins of the famous churches of the ancient and renowned University of Glendalough were visited. In the evening the members dined together at the Koyal Hotel, Glendalough, the president presiding.

THE SHROPSHIRE ARCHÆOLOGICAL SOCIETY.

The Shropshire Archæological Society recently had an excursion to South Shropshire. A visit was first made to Chelmarsh Church, and the Norman and Early English remains to be found there were inspected. The greater part of the church dates from 1345, when Hugh de Mortimer founded a chantry chapel, dedicated to St. James. The east window is a fine one, and the south wall is one of the most finished pieces of Architecture in the country. The church also has a good Elizabethan chalice of honeysuckle pattern. A visit was next paid to Billingsley, the birthplace of Dr. Thomas Hyde, the Oriental scholar, and the church, which is chiefly remarkable for a mediæval wooden porch and a good Easter sepulchre recess, with aisles and chancel and transepts of the Early Decorated period, was also visited. The south transept is of almost unique interest, for the arrangements of a mediæval chantry chapel can still be seen almost complete, while there are also two aumbries, an altar ledge, piscina, tomb and effigy of the foundress, and the original reredos partly fills up the central light of the east window. In the chancel were noticed two mediæval tombs, and in the north transept is one of the finest Elizabethan tombs in England.

MIDLAND CHURCHES.

The first whole-day excursion in connection with the Birmingham Archæological Society took place a few days ago. The ground chosen was entirely unfamiliar. The party proceeded by train to Moreton-in-Marsh, and carriages then took them by the old horseway to Stow-on-the-Wold. Here the ancient church presented many objects of interest. One Perpendicular window is remarkably fine. The chancel has attractive features, though blemished by a gaudiness of colouring which combines with the truly modern stained glass to hurt the eye. The silent and solitary market-place, with its restored cross, is very quaint, and one singular house in it, adorned with Corinthian pillars, was the object of universal attention. The secluded hamlet of Icomb, or P-the-Combe was afterwards visited. The church seems to have been largely rebuilt in Elizabethan times, but there are many traces of more ancient Architecture. The tower is singularly simple and quaint. In what was once the chapel of the Virgin is an effigy supposed to be that of Sir John Blacket, formerly resident of Icomb Place. Icomb Place was next visited. The house is in a very secluded position, and is an interesting specimen of a mediæval manor house. Unfortunately, it has been suffered to fall into occupation as a farmhouse. The greater part had been uninhabited and in ruins, and cattle had been stabled in the drawing-room. Drastic restorations had therefore been necessary to fit it for habitation, and much of the ancient glory has departed. Many features of singular interest still, however, remain, and the question whether the present billiard-room had, or had not, been a chapel was warmly discussed. At Bledington the last halt was called, and here a church was found almost untouched by the spoiler's hand, and so full of attraction that the visitors found it hard to quit. It is apparently of early thirteenth century work. The niches, once

doubtless, occupied by statues of saints, stand, almost uninjured, by the side of the windows. The old carved-oak seats remain, actually worn with age, but practically intact. The very proclamation ordering a collection on behalf of the sufferers from the Great Fire is preserved, and the covers at least of the chained Bible are still chained to the reading-desk.

Enquiry Department.

THE COCK IN SYMBOLISM.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you say why weather-vanes on church spires almost invariably assume a representation of the cock? In the few instances where a variation occurs I have generally been able to assign some historic or local reason.—I am, sir, yours faithfully,

"COCKSURE."

The cock as a symbol is of more than local importance; it is one of the world's symbols, and dates from remotest times. We find it on Egyptian monuments; it was used from early ages as a symbol of fertility, of creativeness. Among the Greeks it was sacred to the Healer, Æsculapius, the Great Physician. We find it on early Christian tombs as a symbol of life. On these tombs two cocks are often shown fighting, one being vanquished, the whole probably intended to represent the battle of life. The cock in mediæval as well as in patristic literature was used as the symbol of liberality and vigilance: of liberality, because, while calling other fowls to eat, he eats little himself; of vigilance, because he wakes at all hours. The cock was again brought into even more intimate relation with religion by our Lord's reproof to Peter, and he now stands a lasting exhortation to watchfulness on almost every spire and tower in Christendom. There are other aspects of this particular symbol, which would, however, require more space than can be afforded.

PERSPECTIVE SKETCHES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly give me information regarding the methods employed by our perspective artists in the production of their drawings? Also, what course of study would you advise a student to follow in order to attain proficiency in the same?—Yours faithfully,

"PUPIL."

Most of our perspective artists spend great pains in pencilling in their work before they commence to ink in. In inking in, some men put in all the darkest shadows first, and then work up the several tones of the drawings; others finish as they go along. The course of study we should advise would be a long course of model, cast, and life drawing, supplemented by as much drawing from Nature as possible. To attain the art of perspective read Ferguson on perspective, and work out all the examples he gives.

An attractive collection of nearly eighty landscapes are now on view at the Modern Gallery in Bond Street, which is rendered doubly attractive by its freshness and originality. Mr. Simpson has a style of his own, and has been particularly happy in his selection of subjects out of the beaten track. He has thoroughly explored Essex, which for pictorial purposes is but little known, and has up to now been but sparsely utilised; he shows us what picturesque material is to be found in this hitherto neglected corner of England. Evidence of this may be found in his spacious and breezy picture "Cattle on the Saltings," the vivid colour and fine atmospheric effect in "Hay Barges Loading, Maldon," the gleam and shimmer in "Winter Sunshine, Kelvedon," the skilful treatment of quaint old buildings in "An Essex Village Street," the truthful and refined rendering of "The Maldon Salt-works," and the delicate feeling for air and sunshine displayed in "Marshland, Early Summer."

KEYSTONES.

In connection with Cemetery Road Baptist Chapel, Sheffield, new schools are to be erected. The cost will be £3000.

CONTRACTS amounting to £7818 have been accepted for the erection of a new Wesleyan College on the Weaponness Estate, Scarborough.

THE Duke of Portland has laid the corner stone of a new wing of the Nottingham General Hospital, which is part of a scheme of extension, costing £50,000.

A NEW church to accommodate 450 people is to be erected at Hindsford, Atherton, at a cost of £7000. The site, which contains 2400 square yards, is the gift of Lord Lilford.

THE new laboratories of the London School of Medicine for Women, 30, Handel Street, Brunswick Square, were opened by the Prince and Princess of Wales on Monday last.

A MISSION church has been erected at a cost of over £1100 at New Houghton, Pleasley, Nottingham. The architect was Mr. P. H. Curry, Derby, and the builder Mr. J. Warner, Pleasley.

THE Salford Board of Guardians has resolved to purchase about twenty acres of land at Weaste, near the Union Infirmary, as a site for the new workhouse, at a sum not exceeding £14,000.

It is now definitely decided that the Queen will not come to town this season from Windsor Castle for the purpose of laying the foundation stone of the proposed new buildings for the South Kensington Museum. The ceremony, under existing conditions, must necessarily be deferred for some time, and will probably not take place till next year.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—For the enlargement of school buildings, being new gymnasium, manual instruction, and cookery rooms, at King-street School, and additions and alterations on the main building, for the School Board. Mr. J. A. Ogg Allen, architect, Board Offices, Aberdeen:—

Masonry.—A. Milne and Sons, Aberdeen
Carpentry.—Watt and Clark, Aberdeen
Slating.—A. Adam and Co., Aberdeen
Plastering.—George Leith, Aberdeen
Painting and Glazing.—John Williamson, Aberdeen

BLACKBURN.—For the erection of sub-structure of additional wing to the infirmary, for the Board of Management of the Blackburn and East Lancashire Infirmary. Messrs. Simpson and Duckworth, architects, Richmond-chambers, Blackburn. Quantities by architects:—
Jno. Cronshaw ... £2,189 J. Whitaker and Son £1,749
Jno. Boland ... 2,180 W. J. Woolf Cronshaw,
Jno. Ferit and Sons ... 1,999 Pump-street, Black-
E. Lewis and Son ... 1,988 burn* ... 1,747
* Accepted.

LONDON PLATE-GLASS INSURANCE CO. Ltd.

Head Office: 49, Queen Victoria St., E.C.
Glass of all kinds covered by the Policies of this Company.
MODERATE RATES. PROMPT REPLACEMENTS.
SURVEYS AND ESTIMATES FREE.

Ten per cent. of the Premiums returned every six years in cases where no claim has arisen.

Applications for Agencies Invited.

Liberal Terms for Business Introduced.

Tools, Valves, and Pipe Fittings in great variety.

H. MUNZING, 199, Upper Thames Street, London, E.C.

CHESTERFIELD.—For pulling down bridge and erecting new one over river Hipper for the Corporation. Mr. H. E. Featherstone, Borough Surveyor, Saltergate, Chesterfield:—

Robert Peck ... £1,295 0 0 R. Holmes & Co. £1,097 11 0
J. Wright, Chesterfield ... 1,105 6 6 * Accepted.

HIGH WYCOMBE.—For the construction of precipitation tank, for the Town Council. Mr. T. J. Rushbrooke, Borough Surveyor, High Wycombe:—

Meridith ... £5,369 0 0 G. Bell ... £4,139 0 0
Clift Ford ... 5,134 0 10 Lee and Son ... 3,699 0 0
Bently and Lock 4,602 11 6 Wycombe* ... 3,699 0 0
G. H. Gibson ... 4,217 0 0 * Accepted.

KETERING.—For the completion of eighteen private streets, &c. (2,600 yards), for the Urban District Council. Mr. T. R. Smith, Surveyor, Market-hill, Kettering:—

Curral, Lewis and ... H. H. Barry ... £8,895 0 0
Martin ... £9,361 15 5 W. G. Wilmott ... 8,594 0 0
Siddons & Freeman 9,313 0 0 F. Barlow, Roth-
Bently and Lock 9,169 5 8 well* ... 8,170 0 0

LEEDS.—For the completion of the new meat market and abattoir, in New York-street and Harper-street, Leeds, for the Corporation:—

Masonry and Bricklaying.—T. J. Wright £9,532 17 8
Joinery.—W. Mason and Son ... 2,112 0 0
Plumbing.—H. Braithwaite and Co. ... 1,099 0 0
Slating.—J. Adkinson and Son ... 430 0 0
Concreting.—S. McFarlane ... 519 12 0
Ironfoundry.—W. Horsfall and Co. ... 2,096 18 9

LEEDS.—For the erection of laundry buildings, &c., Aire-place, Kirkstall-road, for the Laundry Co. Limited. Messrs. Johnstone Bros., architects, 39, Lowther-street, Carlisle. Quantities by architects:—
Charles Meyers ... £3,347 10 E. Taylor and Co.,
Littleborough* ... £3,035 10
* Accepted.

LONDON.—For erecting office and warehouse, Orchard-street, Westminster, S.W., for Messrs. P. S. King and Son. Mr. G. Harold Elphick, architect, Broad-street House, New Broad-street, E.C.:—

J. Greenwood ... £7,174 Grover and Son ... £6,982
W. Downs ... 7,124 Lorden and Sons ... 6,832
Holloway Bros. ... 7,110 Kirk and Kirk ... 6,795
Adamson and Sons ... 7,055 Stanley Bird ... 6,761
Whitehead and Co. ... 6,985 W. King and Son* ... 6,669
* Accepted.

LONDON.—For rebuilding premises, 41, Pitfield-street. Mr. A. P. Stokes, architect and surveyor, 1, Addington-road, Bow:—

J. Weibking and Son ... £1,948 M. F. C. Hoskins ... £1,665
Perry Bros. ... 1,777 Yates and Co.* ... 1,587
S. J. Scott ... 1,687 * Accepted.

NEW BROMPTON (Kent).—For the erection of drapery and art furnishing stores, for Mr. C. Fynn. Mr. E. J. Hammond, architect, 111, High-street, New Brompton. Quantities by the architect:—

H. Wyles ... £2,985 T. Cornelius ... £2,859
J. Wellford ... 935 H. E. Philips, New
J. H. Harris ... 875 Brompton (accepted) ... 830

NORWICH.—For the restoration of nave and a new south aisle to Cringleford Church. Mr. Arthur J. Lacy, architect, and Diocesan Surveyor, 6, Upper King-street, Norwich. Quantities supplied:—

R. Chapman ... £1,040 F. Gunton ... £2,919
J. Downing and Son ... 972 J. H. Smith ... 812
S. R. Wilkins ... 987 G. E. Hawes, Norwich* ... 84
* Accepted.

OXFORD.—For the erection of a gymnasium at "Summerfields," for the Rev. O. E. Williams, D.D. Mr. Herbert Quinton, architect and surveyor, 15, Magdalen-street, Oxford. Quantities by the architect:—

Wilkins Bros. ... £1,338 Hutchins ... £1,075 0 0
Benfield and Loxley ... 1,236 Organ Bros.* ... 1,069 12 4
* Accepted.

PETERBOROUGH.—For the erection of two houses, Parliament-street. Mr. J. G. Stallebrass, architect, North-street, Peterborough:—

Hicks Bros. ... £2470 5 8 Sibley Bros. ... £2435 0 0
Watson and Lucas 440 0 0 Nichols (accepted) 384 10 0
[All of Peterborough.]

IS the Best Material for Roadways, Footways, Damp Courses, Roofings, Warehouse Floors, Basements, Stables, Coachhouses, Slaughterhouses, Breweries, Lavatories, Tennis-Courts, &c., &c.
* VAL DE TRAVERS ASPHALTE, COMPRESSED OR MASTIC. Full Particulars can be obtained from the Offices,
HAMILTON HOUSE, BISHOPSGATE STREET WITHOUT, E.C.

PLYMOUTH.—For making certain structural alterations and additions to the Old Yacht Club premises, Millbay-road, as new offices for the Western Counties Agricultural Association, Limited. Mr. Robt. H. B. Neal, architect, Central Exchange, Plymouth:—

J. P. Berry ... £2,100 0 J. Partridge ... £1,785 0
F. C. Ambrose ... 1,994 18 T. Jenkin and Son ... 1,769 0
J. Goad and Co. ... 1,920 0 A. Andrews ... 1,760 0
Wakeham Bros. ... 1,860 0 A. N. Coles ... 1,754 0
W. Gibson, Exeter ... 1,820 0 J. H. Blachell, Ply-
A. R. Lethbridge mouth* ... 1,737
and Son ... 1,785 0 * Accepted.

PORTSMOUTH.—For the erection of a church to St. Stephen, Portsea, for St. Stephen's Church Building Committee. Mr. H. A. Crowley, architect, 22, High-street, Croydon. Quantities by Messrs. E. M. Whitaker and Mr. C. G. Maylard:—

W. Larnmouth ... £9,130 0 Jas. Crockerell ... £7,527 0
W. Potter ... 8,706 0 Light and Son ... 7,425
Clark and Sons ... 8,267 0 Thos. P. Hall, 7 & 9,
Stephens, Bastow, Bedford-rd., South-
and Co., Ltd. ... 7,998 0 sea, Portsmouth*, 6,866 10
J. M. Perkins ... 7,577 0 * Accepted.

PURNEY (Surrey).—For new roads and sewers on the estate of Mr. R. J. Pettitward. Messrs. Lee and Pain, architects and surveyors, 63, Lincoln's-Inn-Fields, W.C.:—

W. R. Williams ... £1,911 J. Mears* ... £1,851
F. Smith ... 1,883 * Accepted.

REIGATE.—Accepted for the erection of a house at Underhill Park, Reigate, for Mr. C. Taylor. Mr. C. E. Salmon, architect, Bell-street, Reigate:—

W. Bagaley and Sons ... £1,430
ST. LEONARDS-ON-SEA.—For house and shop, Norman-road, St. Leonards-on-Sea, for Mr. W. Beatty. Messrs. Elworthy and Son, architects, London-road, St. Leonards. Quantities by the architects:—

H. E. Crutenden ... £1,436 F. G. Hatton ... £1,230
P. Jenkins ... 1,400 Barter and Gasson ... 1,045
Eldridge & Crutenden 1,395 W. C. Morgan, St.
Padgham & Hutchinson 1,350 Leonards* ... 1,035
C. Harman ... 1,275 * Accepted.

STOCKPORT.—For infirmary extensions, Messrs. Woodhouse and Willoughby, architects, Manchester:—
Byron ... £11,388 T. and W. Meadows,
G. Macfarlane ... 11,290 Heaton Norris* ... £10,803
J. Bainton ... 11,195 * Accepted.

STONEHOUSE.—For new premises, for Mr. John Perry (including the removal and setting back of "Pemeroy's Corner"). Mr. H. J. Snell, architect:—

J. P. Berry ... £3,157 W. Palk ... £2,760
S. Harvey ... 2,837 - Pearn ... 2,735
T. May ... 2,835 G. B. Turpin ... 2,665
T. Crews ... 2,789 J. Jenkin and Son,
H. Blackell ... 2,773 Devonport* ... 2,550
* Accepted.

Building Stones and Quarries of Northumberland and Durham.*

BY GEORGE T. BROWN.

(Continued from page li.)

STRENGTH.—The strength of stone should be ascertained if it is to be subjected to any excessive or unusual stresses. Stones in ordinary building or engineering works are generally under compression, occasionally subject to cross strain, but never to direct tension. It is generally laid down that the compression to which a stone should be subjected in a structure should not exceed one-tenth of the crushing weight as found by experiment. Practically, however, the compression that comes upon a stone in any ordinary building is never sufficient to cause any danger of crushing. The greatest stress that comes upon any part of the masonry in St. Paul's Cathedral is hardly 14 tons per square foot. In St. Peter's, Rome, it is about 15½ tons per square foot. The weakest sandstones that exist will bear a compression of 120 tons per foot, while the resistance of ordinary building stones ranges from 140 to 150 tons per square foot, and in the case of granites and traps rises as high as 700 or 800 tons per square foot. It is possible, however, in some forms of arches, in retaining walls, and in other structures, that a considerable pressure may be concentrated upon certain points, which are liable to be crushed.

WEIGHT.—The weight of a stone for building has occasionally to be considered. In marine engineering works it is often advisable to use heavy stones to resist the force of the sea. A light stone would be best adapted for arches, while heavy stones would add to the stability of retaining walls.

APPEARANCE.—The appearance of stone is often a matter of importance, especially in the face work of conspicuous buildings. In order that the appearance may be preserved, a good weathering stone should, of course, be selected, free from flaws, clayholes, &c. All varieties containing much iron should be rejected, or they will be liable to disfigurement from unsightly rust stains, caused by oxidation of the iron under the influence of the atmosphere. Stones of blotched or mottled colour should be regarded with suspicion. There is probably a want of uniformity in their chemical composition, which may lead to unequal weathering.

POSITION IN QUARRY.—In order to obtain the best stone that a quarry can furnish, it is often important that it should be taken from a particular stratum. It frequently occurs that in the same quarry some beds are good, some inferior, and others almost utterly worthless for building purposes, though they may all be very similar in appearance. The want of this precaution led to the use of inferior stone (though from very carefully chosen and good quarries) in the Houses of Parliament. It may be interesting to relate the method in which this stone was selected. In 1838-9 a Royal Commission sat to inquire and investigate, consisting of Sir Chas. Barry, Dr. Wm. Smith, and Sir Henry de la Beche (geologists), and Mr. C. H. Smith, an eminent builder. One of the forms of inquiry—which inquiry, by the way, was commenced in this district, and these forms printed in Newcastle—required most minute particulars of all kinds.

It may be interesting to give this form here—it was as follows, and is from the President's address to the Members of the Tyneside Natural Field Club, as published in Vol. III., p. 14, of the Transactions:

"One of the forms for making the several requisite inquiries, which was printed in Newcastle, may serve as an example of data for collecting such information:

"**TOPOGRAPHY.**—Name of place? Name of county? Nearest post town? Name of quarry?

"**OWNERSHIP.**—Owner or lessee of royalty? Address of agent? Charge for royalty? Name of the parties now working the quarry?

* A paper read before the Northern Architectural Association.

"**NATURE OF STONE.**—Designation? Component part? Colour? Defects? Depth of beds of workable stone? Names, qualities, and thickness of the different lifts in their order downwards? Cubic feet per ton? Weight per 6ft. cube when quarried? Ditto when dry? Powers of absorption? Resistance to pressure? Effects of freezing? Sp. G.?

"**STATE OF QUARRY.**—When opened? How much saved? Thickness of cover? If in full work? Means of working? State of quarry head? Angle or rate of dip? Working with reference to dip? If production of wall stone, and of what thickness? Distance of joints?

"**SUPPLY.**—Present and probable power of supply? Price at quarry of scantlings squared to order per foot? Price of wall stone (if any) at per ton? Description, extent, and cost of carriage to London? Cost of plain work per foot at London wages? Cost delivered in port of London?

"**GENERAL REMARKS.**—If employed in Roman works, and where? Names and dates of buildings? Ancient and modern wherein employed, and present state of the stone?"

Professor Kerr, lecturing some ten years ago in connection with the Carpenters' Company, relates how this commission finally came upon a Norman church at Southwell, in Nottinghamshire, with its carvings as clean cut as if done the year before. The stone was carefully examined, and found to be Mansfield Woodhouse, which the commission determined should be used. By the time the basement had been built, the supply of stone gave out. They next found the Anston stone, in the same neighbourhood, a stone partly made crystalline by a wave of heat passing through a certain portion of the quarry, the crystalline and non-crystalline stone being quite indistinguishable. Mr. C. H. Smith, who was appointed to examine the stone as it arrived, declined to do so, owing to some difficulty in the matter of his remuneration, with the consequence that the stones not being checked, the non-crystalline found their way into the buildings, and have had ultimately either to be renewed or coated with some preservative.

SEASONING.—Nearly all stone is the better for being seasoned by exposure to the air before it is set. This seasoning gets rid of the moisture, sometimes called "quarry sap," which is to be found in all stone when freshly quarried. Stone should, if possible, be worked at once after being quarried, for it is then easier to cut, but unless this moisture is allowed to dry out before the stone is set it is acted upon by frost, and thus the stone, especially if it be one of the softer varieties, is cracked or sometimes disintegrated. The drying process should take place gradually. If heat is applied too quickly, a crust is formed on the surface, while the interior remains damp and subject to the attacks of frost. Some stones, which are comparatively soft when quarried, acquire a hard surface upon exposure to the air.

NATURAL BED.—All stones in walls, but especially those that are of a laminated structure, should be placed "on their natural bed"—that is, either in the same position in which they were originally deposited in the quarry, or turned upside down, so that the layers are parallel to their original position, but inverted. If they are placed with the layers parallel to the face of the wall, the effect of the wet and frost will be to scale off the face layer by layer, and the stone will be rapidly destroyed.

In arches, such stones should be placed with the natural bed as nearly as possible at right angles to the thrust upon the stone, that is, with the "grain" or laminae parallel to the centre lines of the arch stones, and perpendicular to the face of the arch. In cornices with undercut mouldings the natural bed is placed vertically and at right angles to the face, for if placed horizontally, layers of the overhanging portion would be liable to drop off. There are, in elaborate work, other exceptions to the general rule.

It must be remembered that the beds are sometimes tilted by upheaval subsequent to their deposition, and that it is the original position in which the stone was deposited that must be ascertained. In others it can only

be traced by thin streaks of vegetable matter, or by traces of laminae, which generally show out more distinctly if the stone is wetted. In other cases, again, the stone shows no signs of stratification, and the natural bed cannot be detected by the eye. A good mason can, however, generally tell the natural bed of the stone by the "feel" of the grain in working the surface. A stone placed upon its proper natural bed is able to bear a much greater compression than if the laminae are at right angles to the bed joints.

None of the stones in the list on the next page are red sandstones. That most used in this neighbourhood is Corncockle. The following remarks are taken from Gwilt:—Corncockle Quarry, one of the oldest of the new red sandstone quarries in the south-west of Scotland, is situated about three miles from Nethercleugh station, on the Caledonian Railway. It is obtained in any size blocks up to ten tons. The colour is a light red, and very uniform; slight black streaks occur here and there, which are a form of mica, but they disappear entirely after twelve to fourteen months exposure. The beds are from 1ft. to 3ft. thick, with an occasional one up to 4ft. 6in. The stone is considered locally to be the most durable of all the Dumfries red sandstones, and to keep its colour best. It contains a very high percentage of silica, and stands frost well, as also the sea air, and is a free working although a strong stone. Its crushing strain is 2·38 tons per square inch, applied on a block of 1½ in. cube.

GWILT ON STAINTON STONE.—As a conclusion to the report, it may be satisfactory to name the actual stones used in the construction of the first portions (1840) of the Houses of Parliament. The foundation was laid in Penryn granite, rising to the level of the ground, therefore but little seen. Above it is Fogtor granite from Dartmoor. A small portion only of the superstructure, to the top of the basement windows, was built with Bolsover Moor stone from near Chesterfield; after which Anston stone was used for the remainder of the outside works. In the interior, Painswick and Caen stones have been employed; St. Stephen's crypt is of Beer stone. It has been asserted that had Government employed a supervision at the quarries to prevent imperfect blocks being sent up to London, the present unsightly appearance of many parts of the building would not have resulted.

THE UTILISATION OF WATER POWER.

THE utilisation of water power, which has been left unnoticed and unexploited for thousands of years, is now progressing by leaps and bounds. Not only have private initiative and private capital been extensively interested in this movement, but in various countries the Governments have more or less directly stepped in. This has hardly been done in a more rational manner anywhere than in France, where the Minister for Public Works has framed regulations for the most advantageous exploitation of water power. It is proposed, says Engineering, that the Government shall grant concessions for the use of water power to private individuals or to companies, as the case may be. The authorities hope that it will be possible, by properly utilising the water power of the country, to materially reduce the imports of coal, which, for the last ten years, represent an annual average of some £6,000,000. The aggregate

WATER POWER OF FRANCE

is estimated at about 10,000,000 horse-power, of which at present only about one-twelfth has been exploited. Most of the important waterfalls are located high in the mountains, and have hitherto had a merely local, if any, importance. There are, however, several good-sized waterfalls more favourably situated, although the distance has ceased to be a matter of great importance. In the neighbourhood of Lyons there is a Rhone fall estimated at 12,000 horse-power, the Loire is

thought capable of yielding some 1000 horse-power, easily available, etc. Apart from the merely financial advantages, a rational utilisation of the immense water power is also likely to prove a social benefactor, inasmuch as it is likely to decentralise numerous industries, calling forth industrial life in new places, and, it is hoped, give an impetus to many home industries which have nearly vanished, but for

which the easily disturable electric power is so admirably adapted. Also, the Swedish Government is keenly alive to the question of

ELECTRIC TRANSMISSION OF WATER-POWER, and one or two schemes of this nature have already been brought forward. The most recent is the utilisation of the large Eefkarleby waterfall, owned by the Swedish State, and

situated some fifty-five miles from Stockholm. The water-power of the fall is calculated at no less than 100,000 horse-power, but the present project only deals with one-fifth of this large total, which it is proposed to transmit to Stockholm. The power transmission is calculated to cost some £231,000, the power station, with machinery, about £178,000, and buildings, &c., in Stockholm, £28,000.

MASONRY.

By JAMES WILDING.

V.

ENLARGING AND DIMINISHING MOULDS.—The method illustrated by this example is exceedingly simple. It has the further advantage of proportional enlargement and reduction in a case where the same depth is required with less projection. The details are usually supplied full size, sometimes, however, owing to the quantity required and the room taken up in an office by setting out full size, drawings a quarter or eighth full size are sent—it then becomes the duty of the mason to enlarge them for his own use.

In the example the section to be enlarged is half full size.

Draw the line A E at the angle of 45 degrees (this angle is not arbitrary, but is very convenient) equal to height of mould given, square out A H and E K. Mark the profile of mould inside this figure.

From E draw E B, a line at 45 degrees to E A, make E B equal to twice E A, from B square B C, from E square E D, both indefinite in length.

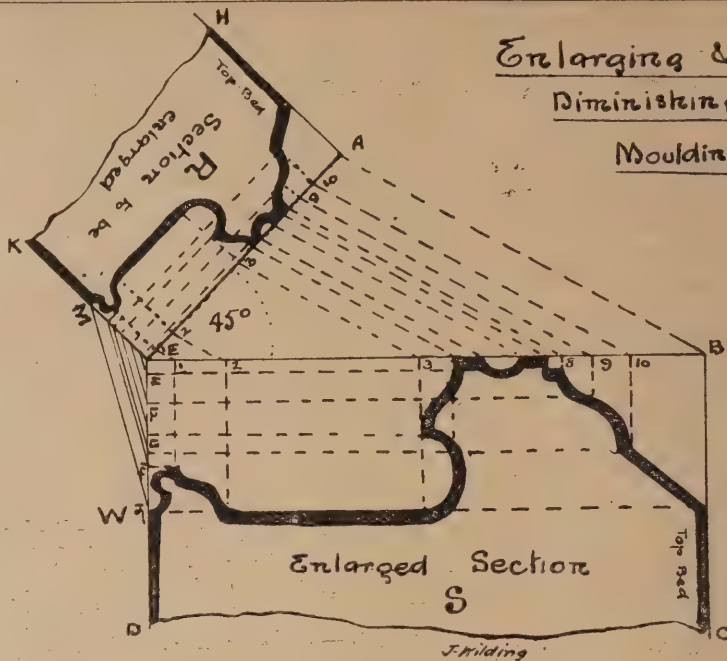

In section R, take any number of points in

the mould profile—draw them parallel to A H to touch the line A E, and from the points of contact draw lines parallel to A E to touch E K. Connect A B; parallel to A B draw the lines 1 to 10 to touch the line E B, draw these square from E B, indefinite in length. From E make E W equal to twice E M; connect M W. Draw the lines that touch E M between the said letters parallel to M W, numbered 11 to 15. Draw the lines E 11 to 15 parallel to E B. Through points of intersection trace the mould, which is thus enlarged to twice the size. From this the required mould is made.

DEVELOPMENT OF MOULD ON A SPLOYED JAMB TO BE APPLIED TO SEGMENTAL HEAD WITH A LEVEL SOFFIT.—It is often necessary to splay the jambs of a window internally to allow a greater amount of light to enter a building. In many instances the inside treatment is in plaster. In other cases the whole of the window treatment is stone. A simple mould is chosen in order to minimise difficulty. The first need is to understand thoroughly the relationship of the "Plan of the Splayed Jamb," and the Developed Section Mould. The first is horizontal; the second is developed on and from a vertical line. The line F E is to be regarded as a hinge line, and the developed section turned to the right until it is at right angles with the paper. The line X Y in plan is also to be regarded as a hinge line, and the plan turned up until it is at right angles with the paper; the two moulds are then turned in their relative positions one to

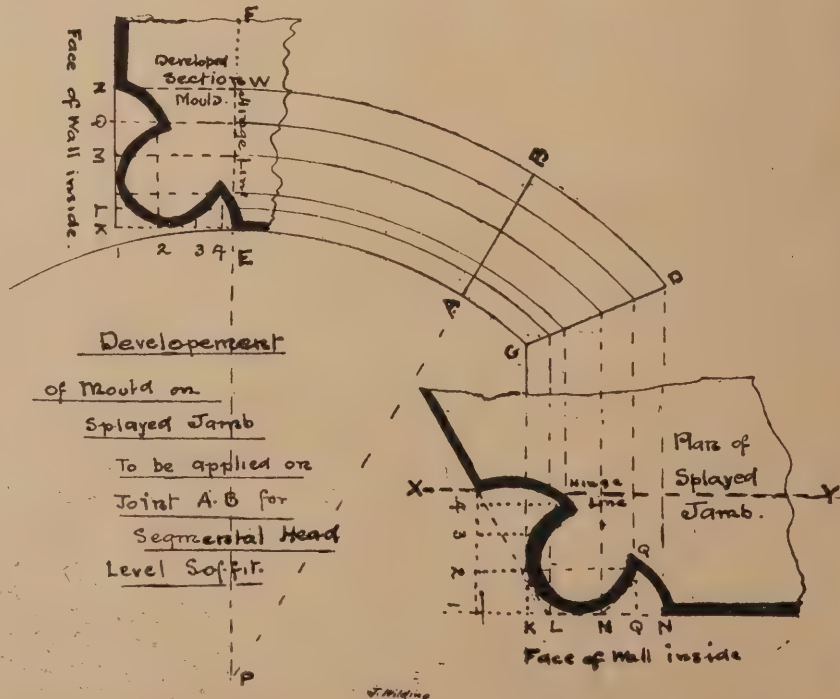

Enlarging & Diminishing Mouldings

the other. The point P is used to describe the segment E G; the developed section applies on any joint line drawn from point P, for example, A B. Carefully examine the plan of splayed jamb—K N is the portion that runs round the segmental head on the inside of the wall; erect the vertical line, K G, N D, with P as centre, and P A, P B as radii, draw the arcs G A E and D B W; connect G D; take any number of points in plan—L M Q—erect these lines to touch G D, from the points of contact on G P, and with the centre P, turn these divisions round to touch the vertical line E F, from E F square these out to the left—indefinite in length.

Now examine the plan again. The divisions 1, 2, 3, 4, X give the distance from the face line inside, transfer these to E K on the developed section. Draw from the points thus obtained perpendicular lines to intersect with the horizontals N Q M L K, through these trace the mould profile for the segmental head.

CONICAL COVERING FOR CIRCULAR TOWER.—All the problems with relation to the covering of circular buildings are replete with interest. Whilst the day of the great stone dome may be said to be over, many smaller examples are of daily occurrence. The first

step towards a full understanding of this kind of construction is to master the underlying principles. No knowledge of masonry can be regarded as anything like complete unless the cone and its possibilities are clearly understood. The example before us is the easiest that could be used to illustrate the principles involved. These should be carefully studied, as further on, in the study of dome construction, reference will be made to them from time to time.

Only half plan is shown—that being sufficient for the present purpose—and a section through the cone. From examination of the figure it will be seen that the beds are square to the rake of the cone, each complete ring thoroughly tying itself, and preventing any sliding motion. Usually the most difficult line to explain is the curved line, X M, at the left-hand side of the figure, and the bottom line of outside mould No. 1. Taking the apex A, of the cone as a centre, and the length, A X, as radius, describe the arc, X M, indefinite in length. If it is desired to make this arc the full length of the circular plan, the plan must be measured. A simple way of doing this is shown in the example. A Y, A X being at 60 degrees to X Y, produce A X to W and A Y to Z. Through F draw W Z parallel to X Y. W Z is the length of the curved line X F Y, and thus half the length of the full circle. With A as centre, describe I L from A, and from point M (which should be a convenient length, say 3ft. or 4ft.) draw the joint line L M. This operation is repeated for each course; for the sake of clearness it is done alternately on each side. These are the moulds for the outside. If this drawing is made on thin cardboard, turned up on line X Y at right angles to the paper, and the several moulds cut out and bent round into position, it will be seen the line X M (continued to the length W Z) will sit level on X F Y; and the other moulds, cut and bent into position, will each rest on the line below it, and give a level bed. If the student has grasped the principle of obtaining the length of X F Y by means of the line W Z, he will be able to apply it to obtain the length of R N and S P respectively. The inside developments are obtained in a similar way to the outside ones—one small portion is indicated in the example. The student is recommended to take pains to master the principles here explained; he will find them of infinite value when further problems are studied. The points on A D, lettered C B, etc., give the centres from which the various bed moulds are struck, and to which all joint lines radiate on plan of each respective course.

VENTILATION OF THE FRAM.

THE new expedition to the North Pole, under the leadership of Otto Sverdrup, Captain of the Fram during Dr. Nansen's expedition, left Christiania in that now historic craft on its second adventurous voyage to the White North on Friday, 24th June. Considerable alterations have been effected in the Fram, which is now much more comfortable and seaworthy than when it first set out for the Pole, five years ago to the day. The upper deck has been converted into the main, and is entirely roofed in by a new flush deck. The saloon, which is some 18ft. square, is situated forward. Special provision has been made for the ventilation of this part of the vessel, which is effected by the "Boyle" system of ventilation originally designed for the Fram (as per the accompanying diagram) by Messrs. Robert Boyle and Son, Ventilating Engineers, of London and Glasgow, to whom Dr. Nansen at that time wrote:—"I am convinced that your ventilating system will prove to be of the utmost value in those regions where the ship for years will be our dwelling, and where, of course, good ventilation is *conditio sine qua non* for our health and sanity." On the Fram, as altered, the ventilators are fixed on the flush deck, so that the wind can reach them freely and unobstructedly from every quarter, ensuring their efficient action with the wind blowing from any direction.

SANITARY CONGRESS.

THE preliminary programme of the sixteenth congress of the Sanitary Institute to be held in Birmingham, from September 27th to October 1st, has now been issued. The president of the congress is Sir Joseph Fayrer, Bart., K.C.S.I., M.D., F.R.C.P., F.R.C.S., LL.D., Q.H.P., F.R.S. Dr. Christopher Childs, M.A., D.P.H., will deliver the lecture to the congress, and Dr. Alex Hill, M.A., J.P., Master of Downing College and Vice-Chancellor of Cambridge University, will deliver the popular lecture. Excursions to places of interest in connection with sanitation will be arranged for those attending the congress. A conversation will be given by the Right Hon. the Lord Mayor (Councillor C. G. Beale), and a garden party, at the Botanical Gardens, Edgbaston, will be given by members of the sanitary committee. It appears from the programme that over 300 authorities, including several county councils, have already appointed delegates to the congress, and, as there are also over 2000 members and associates in the Institute, there will probably be a large attendance in addition to the local members of the congress. In connection with the congress, a Health Exhibition of apparatus and appliances relating to health and domestic use will be held as a practical illustration of the application and carrying out of the principles and methods discussed at the meetings; which not only serves this purpose, but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the congress. The congress will include three general addresses and lectures; three sections meeting for two days each, dealing with (1) Sanitary Science and Preventive Medicine, presided over by Alfred Hill, M.D., F.R.S. Edin., F.I.C., M.O.H., Birmingham; (2) Engineering and Architecture, presided over by W. Henman, F.R.I.B.A.; (3) Physics, Chemistry, and Biology, presided over by G. Sims Woodhead, M.D., F.R.C.P., F.R.S. Edin.; five special conferences: Municipal Representatives, presided over by Ald. W. Cook, Chairman of the Health Committee, Birmingham City Council; Medical Officers of Health, presided over by John C. McVail, M.D., D.P.H., F.R.S. Edin.; Municipal and County Engineers, presided over by T. de Courcy Meade, M.Inst.C.E.; Sanitary Inspectors, presided over by W. W. West, Chief Sanitary Inspector, Walthamstow; Domestic Hygiene, presided over by Mrs. C. G.

Beale (the Lady Mayoress). The local arrangements are in the hands of an influential local committee, presided over by the Right Hon. the Lord Mayor of Birmingham, with Prof. A. Bostock Hill, M.D., D.P.H., W. Bayley Marshall, M.Inst.C.E., J. E. Willcox, Assoc. M.Inst.C.E., as honorary secretaries.

Trade and Craft.

HALL'S SANITARY WASHABLE DISTEMPER.

A new sanitary water-paint which is a strong disinfectant and pleasant to look upon—this, in short, is Hall's Sanitary Washable Distemper. Its aim is to combat the sanitary dangers of our walls, and at the same time to afford a wall-covering in every way desirable. Herein, under the favourable auspices of Messrs. Sissons Bros., Limited, of Hull, whose name on a tin of paint has grown to be recognised as the hall-mark of excellence, this distemper has attained considerable success. Public apathy cannot long withstand real merit. Genuine worth, as a rule, meets with recognition sooner rather than later—it has been sooner in the case of Hall's Sanitary Washable Distemper. We believe the patent is a good one; the trade thinks so, too. It is a death-dealer to all insects, yet it is free from Caustic and Alkali. It is non-poisonous and clean in working; it may be applied to a damp wall, and wherever used it will not scale off, but preserve its original freshness in the many tints in which we see it. Another desideratum is its ease of application. No solution or liquid other than hot or cold water for mixing is required, and the most inexperienced dabbler in paint inevitably succeeds in using Hall's distemper. Its covering power and durability, it is claimed, are incomparably great, and whilst this patent is suitable for all kinds and conditions of rooms and of countries, it is especially recommended for colonial work. Combining, as it does, so many practical advantages with a very considerable saving in the cost of materials and labour, this distemper seems to justify the wide popularity it has already attained.

THE Great Western Railway Company is about to undertake an important alteration on the Great Western approach side of its Cardiff station. The Company has decided to continue the subterranean passage from the down side straight into the roadway.

PROPERTY & LAND SALES.

Close to railway stations on L. and N.W., Midland, Met., and N.L.; also bus routes to City and West-end.

MR. LEOPOLD FARMER will SELL by AUCTION, at the Mart, E.C., on WEDNESDAY, JULY 27th, 1898, at Two o'clock, the following:—**WEST HAMPTON.**—With possession.—3, Sher-riff-road, West-end-lane.—Freehold detached Residence, having five bed and dressing rooms, bath, two reception rooms, conservatory, usual offices. No basement.—Solicitors, Messrs. Fytche, Field, and Baker, 23, John-street, W.C.

ST. JOHN'S WOOD.—With possession.—117, Alexandra-road.—Long Leasehold Residence, having six bed and dressing rooms, bath, three reception rooms, usual offices. Good garden.—Solicitors, Messrs. Yeo and Co., 41, Finsbury-pavement, E.C.

Particulars and conditions of sale at the Mart, E.C.; the respective Solicitors; and the AUCTIONEER, 46, Gresham-street, E.C., and Kilburn, N.W.

Little Ilford, within a few minutes from East Ham, Ilford, and Manor Park Stations.—Fourth Auction Sale.

THE PREMIER LAND COMPANY

(Limited) having sold every lot at their previous auction sales, will SELL by AUCTION, at the PUBLIC HALL, Plashet-grove, East Ham, on WEDNESDAY, JULY 20th, 1898, at 7.30 in the evening precisely, 120 valuable FREEHOLD PLOTS, including frontages to Rectory-road and Elsenham-road, also valuable shop plots in Church-road. No tithe or land tax. Payment by instalments, spread over 44 years, if desired. Possession on payment of deposit. Free conveyances. The new roads are formed and kerbed, and have separate sewers and surface water drains.—Particulars, with plan and conditions of sale, may be obtained, when ready, at the place of sale; the principal hotels in the neighbourhood; of the PREMIER LAND COMPANY (LIMITED), 10, New Broad-street, E.C.; Messrs. TAYLOR and TAYLOR, Solicitors, 10, New Broad-street, E.C.; or of Mr. H. A. RAWLINS, Surveyor, 45, Queen Victoria-street, E.C.

HILL PARK ESTATE, Westerham, Kent, twenty miles from London, 500ft. to 700ft. above sea level.—FREEHOLD choice BUILDING SITES for SALE on this rising, high-class residential estate, from one acre and upwards. Chalk subsoil; magnificent views. Also excellent, well-built Residences to be Sold or Let. Rents from £50 to £250 a year. Water supplied by the West Kent Water Company. Fast through trains to and from City daily.—Apply to the RESIDENT AGENT, on the Estate.

TO BUILDERS.

The Freeholder of a large suburban Estate (S.W.) wishes to meet with ONE or TWO BUILDERS accustomed to building good-class suburban property of from £60 to £120 a year rental. Main road, prettily wooded sites for houses. Plenty of ground to each plot, several having tennis lawns; main drainage; cricket and tennis clubs and three golf courses within a mile. Eight miles from Royal Exchange. Some shop plots adjoining railway station on main road. The land will be sold or let with restrictions, and advances can be had. Unquestionably one of the best things going at the present time for the right man.

Freeholder's Surveyors and Architects, Messrs. CHESTERTON and SONS, 51, Cheapside, E.C.

Lambeth.—Valuable Ground Rent, with Reversion in 1916.

MESSRS. ARBER, RUTTER, and WAGHORN will offer for SALE, at the MART, Tokenhouse-yard, City, on WEDNESDAY, JULY 20th, at One o'clock precisely, a well-secured COPYHOLD GROUND RENT of £20 10s. per annum, arising out of the five messuages, Nos. 90, 92, 94, 96, and 98, Vauxhall-walk, with reversion at Christmas, 1916, to the rack rents, estimated at £175 per annum.

Particulars of sale of Messrs. WEBB, NICHOLS, and Co., Solicitors, 11, Argyl-street, W., and of the AUCTIONEERS, 1, Mount-street, W.

Unusual opportunity of acquiring a high-class Marine Freehold Residence at Bognor-on-Sea.—Purchasers need only pay a deposit of 10 per cent., the balance by half-yearly instalments extending over nine years.—The imposing House, No. 2, Park-terrace, in an exceedingly pleasant position on the esplanade, facing the sea. It contains eight airy bedrooms, four spacious reception rooms, and ample domestic offices. Suitable for a high-class boarding house. Also Freehold Houses, 3 and 4, Lansdown-place; let at £65 and £70.

MR. GEORGE F. HARRINGTON will SELL the above by AUCTION, at the MART, London, E.C., on JULY 26th, at TWO, in three lots.

Particulars of W. J. MYATT, Esq., Solicitor, 23, Abchurch-lane; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

By order of the Trustees of the late Robert James Chaplin, Esq.—Cattord.—To Builders and others.—10a. or 18p. of Freehold Land, situate in a first-class position, with possession at Christmas next, when part will be available for building, having existing frontages; also a Freehold Ground Rent of £30 a year, secured on residences, in the same neighbourhood, which will be Sold by Auction by

MR. GEORGE F. HARRINGTON, at the MART, E.C., on JULY 26th, at TWO, in two lots.

Particulars of Messrs. BADHAM and WILLIAMS, Solicitors, 3, Salters' Hall-court, E.C.; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

FREEHOLD BUILDING LAND.—TO BE

SOLD, a valuable BUILDING SITE, with extensive frontage to Lordship-lane, East Dulwich, and having an area of over 45,000ft. super. Suitable for the erection of a school or public building. Price £2000. Also several smaller plots, prices £140 to £600.—Plans and particulars of Mr. A. R. VIZARD, 12, Regent-street, Pall-mall, S.W.

MESSRS. GREEN and SON, AUCTIONEERS and SURVEYORS, 23 and 29, St. Swithin's-lane, London, Beg to announce that their SALES by AUCTION of FREEHOLD, LEASEHOLD, and COPYHOLD PROPERTIES, Ground Rents, Life Policies, and Reversions take place at the MART on the LAST FRIDAY in the MONTH, and on such other occasions as may be arranged.—Particulars are invited 21 days prior.

MESSRS. GREEN and SON undertake SURVEYS and VALUATIONS of LAND and HOUSE PROPERTIES, as well as Machinery and Plant, for

Ratings, Compensations, Partnerships, Assessment Appeals, Estate Duties, Dilapidations, Fire Losses, Mortgages, and other purposes. Estates managed and rents collected under Receiver-ship and other powers.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ARCHITECTURAL INSTITUTE and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, personally or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

WATERPROOF COVERS, made from very best Navy canvas, 12ft. by 9ft. 15s.; 15ft. by 9ft. 18s. 9d.; 15ft. by 12ft. 25s.—Any size, at 1s. 3d. per square yard, can be sent on approval from H. J. GASSON, Government Contractor, Rye.

MARBLE.—Victoria or Cork Red, in blocks, from Viscount Middleton's quarries.—For sizes and prices at nearest depot, apply to J. PENROSE FITZGERALD, Estate Office, Middleton, co. Cork.

REQUIRED, BUILDERS to take up BUILDING SITES in Westminster; also Newton Butts. Finances will be arranged.—Apply No. 37, 11, Victoria-street, S.W.

WANTED, an established SANITARY PLUMBER'S BUSINESS in large town; must bear strict investigation; owner might possibly remain as manager.—Reply fully to Box 888b, BUILDERS' JOURNAL.

CARPENTER and JOINERS' work, stairs, &c., WANTED. Piece work labour only; any description; large quantity preferred.—Box, 756, BUILDERS' JOURNAL Office.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

JUNIOR ASSISTANT or IMPROVER WANTED.—Apply, by letter, to HUNT, 34, Queen-street, E.C.

WANTED, capable ARCHITECT'S ASSISTANT. Well up in Renaissance, detail, and design.—Apply, stating qualifications and salary required, to GELDER and KITCHERS, Architects, Hull.

COSTING CLERK REQUIRED, accustomed to Builder's or Engineer's office. Must be quick at figures. One with a knowledge of architectural drawing preferred.—Address, stating age, salary expected, with copies of testimonials, to Box 771, BUILDERS' JOURNAL Office.

ARCHITECT'S JUNIOR ASSISTANT REQUIRED. Must be neat and accurate draughtsman.—Address, by letter only, stating age, salary required, and references, to Mr. W. G. R. SPRAGUE, Fitzalan House, Arundel-street, Strand.

ASSISTANT.—WANTED (immediately) a competent ASSISTANT, accustomed to supervising and measuring up paving, builder's and general jobbing work, thoroughly well acquainted with London prices and used to checking accounts.—Apply, by letter, immediately, inclosing copies of recent testimonials, stating experience and salary required, to the ENGINEER, Public Health Department, Guildhall, London.

ARCHITECT'S ASSISTANT WANTED. Must be good at details.—State age, experience, and salary, WAITELEGG and WHITTAKER, Brazen-nose-street, Manchester.

JUNIOR ASSISTANT or IMPROVER WANTED in Architect's Office.—Write, stating terms and full particulars, to GOYMOUR CUTHBERT, 83, Queen-street, Cheapside, E.C.

LAND SURVEYOR'S ASSISTANT REQUIRED. Age about 25. Must be an accurate and reliable surveyor. Permanency for suitable man.—Reply, stating age, experience, and salary, to Messrs. FLOCKTON, GIBBS, and FLOCKTON, 15, St. James-row, Sheffield.

WANTED, a MANAGER for Building Department, with practical experience. Applicants to state age, references, experience, and salary previously received.—Address, DIRECTORS, Lever Brothers, Limited, Port Sunlight, Cheshire.

MANAGING ASSISTANT.—A leading Architect has VACANCY for first-class MANAGING ASSISTANT and DRAUGHTSMAN. Good salary offered.—Apply, stating references and age, to S. A., care Eason and Son Ltd., Advertising Agents, Dublin.

ARCHITECT and SURVEYOR'S ASSISTANT REQUIRED. Must be a neat and quick draughtsman, and able to write specifications. Preference to one with knowledge of quantities and measuring work.—Send specimen drawings, age, salary, and particulars, F.R.I.B.A., 7, Bank-buildings, Ilford, Essex.

ARCHITECTURAL ASSISTANT (fully qualified) WANTED at once. Good at perspective and details.—Write, stating age, experience, salary expected, with copies of testimonials, to ARCHITECT, 3, Hyde-gardens, Eastbourne.

EXPERIENCED ARCHITECTURAL ASSISTANT WANTED for a permanency in the Midlands. Must be well up in details, able to take off quantities, and with some experience in surveying and levelling.—Apply, stating age, experience, and salary required, to Box H., Office of BUILDERS' JOURNAL.

JUNIOR ASSISTANT or IMPROVER REQUIRED in an Architect and Surveyor's Office. Good opportunity for learning and gaining practical knowledge.—State, in own handwriting, age, experience, salary expected, and reference, E. S. W. INGLEDEW, Crawford-street, Camberwell, S.E.

ARCHITECTURAL DRAUGHTSMAN (well qualified) WANTED. Send specimen drawings in pencil, and photo portrait.—State qualifications, salary, age (should not be less than 30), and apply by letter to FRANK W. RICH, 1, Eldon-square, Newcastle-on-Tyne.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office. G. SCORER, 28, Newman-street, W.

INFECTIOUS DISEASES HOSPITALS.—Expert confidential ASSISTANCE rendered on designs for above by ADVERTISER; formerly draughtsman for Local Government Board; highly successful in competitions, for which moderate speculative terms are offered.—G. B., Caen Cottage, Ryde, Isle of Wight.

ARCHITECT and SURVEYOR'S GENERAL ASSISTANT (24) DISENGAGED. Nearly seven years' first-class experience in London and the provinces. Thoroughly reliable and competent. Especial experience in Poor Law and hospital work. Excellent references.—R., 47, Cotleigh-road, West Hampstead, N.W.

SURVEYOR'S or ARCHITECT'S ASSISTANT desires ENGAGEMENT in South of England, south-west preferred. Can abstract and bill. Good draughtsman.—E., Tucker's Library, Esplanade, Weymouth.

ASSISTANT seeks ENGAGEMENT in First-class ARCHITECT'S OFFICE, at small salary, with view to buying future partnership; Great Britain or abroad.—Address, C., Alma House, Long Eaton, Derbyshire.

ESTATE AGENT'S CLERK desires BERTH in Builder's or Architect's Office. Good at tracing and designing.—Address H., 12, St. John's Hill, Clapham Junction.

An Architectural Causerie.

A Line of Cleavage in Professional Opinion.

It has often seemed to us that insufficient thought is given to the question underlying the handling of old buildings by the older and more modern schools of architects. We do not mean the question of "repair" versus "restoration," but the more funda-

passes out of the region of ancient buildings and affects our whole conception of original creativeness in modern Architecture. "Let us have no more fourteenth century reconstructions," say the younger school. "Let us have no more north porches to Westminster Abbey"—"a very clever diagram" as William Morris called it—not in the least interesting as modern Architecture; but only as a personal expression of the late Mr. Pearson's conception of something that never existed. We do not want to put back the clock any more, we want to go on. If new building is to be, it shall be in the spirit and manner of our own times, and not a falsification of bygone times, and our reverence for what is best in our own imagination—our own creative instinct—shall make us doubly conservative of what is still left to us of the great creation of times past. Let us build new buildings, but let us save the old. That, we take it, is the spirit in which the younger school is setting to its work.

C. R. A.

draw attention and condemnation to the latest street excrescence which is springing up in many of our most important thoroughfares. It consists of a hexagonal telephone box, about 5ft. in diameter, and 18ft. in height, with an attenuated dome in ornamental (?) cast-iron, from which emanates the telephone wire, which has to soar away to the nearest pole, generally some 40ft. or 50ft. higher up. The windows of the box are carefully plastered over with gelatinous advertisements, with the dual object, apparently, of preserving privacy for the occupant of the box, and parading publicly the advantages of the advertised articles. One had thought that it would have been difficult to conceive anything in worse taste than the newspaper kiosks which exist in Hyde Park and elsewhere; but this latest London structure eclipses anything we have yet had hoisted upon a long-suffering public. Another matter which should not be left unnoticed is the increase of corrugated iron cabmen's shelters, which are

A SKETCH AT THE ROYAL ACADEMY.

mental principles that underlie and determine what may not unreasonably be termed a distinct line of cleavage in professional opinion. It is a matter which often comes to a head when an important case has to be considered upon its merits, when some eminent Academician is upon one side and the Anti-Serape upon the other; then there is a call to arms, and the rival schools for the most part divide themselves into two camps. The controversy over the Peterborough front was a case in point. Those who looked below the surface in that controversy will have observed how most of the professional signatories to what Mr. T. G. Jackson—perhaps, quite truly—called at the time the "irrational petition" to the Dean and Chapter, were of the younger generation, pupils, for the most part, of Mr. Bodley, Mr. Norman Shaw, the late John Sedding, and others. Such of the old men as might have signed stood aside on the ground of professional etiquette, and, doubtless, where conviction was not strong, such etiquette was only right and proper. To begin with then, we are observed in a matter of training. The older school—to which, among others, Sir Arthur Blomfield may be said to belong—has been trained. The question thus becomes a large one. It

"Boxes, Shelters, and Hoardings."

FROM time to time the passer-by receives little shocks of surprise at some excrescence of street architecture, which, more perhaps from its newness than its vulgarity, claims the attention of the least observant. Yet, as the days go by, and he passes and repasses it, his eye gradually accustoms itself to the abortion, which seemingly has settled into quite a congruity with its environments. It is quite a depressing state of things when one discovers that some particularly hideous object has ceased to irritate one, and that, without being aware of the fact, one has grown to accept it. Whilst, to some degree, at all events, this is inevitable in the case of permanent buildings, which, *volens volens*, one is forced to suffer, this does not apply to structures which are more or less of a temporary nature. It seems therefore disastrous to accustom one's eye to that which could easily be improved or removed, but which—so long as no protest is raised against its existence—will flourish in its nastiness, and probably be perpetuated *ad infinitum*. One hopes that it is not already too late to

wretched travesties of the nice little shingle-roofed structures designed by Mr. Max. Clarke. To have these pleasing and picturesque features caricatured in corrugated-iron painted green, is not only in execrable taste, but extremely unfair to the architect who designed the original shelters. Arson being a criminal proceeding, all that one can do under the present circumstances is to agitate for the demolition of these excrescences, to which one trusts one will never grow reconciled. Fortunately the passer-by sometimes receives very pleasant surprises, and it is with real satisfaction that one notices the enormous improvement in the decoration of the hoardings and gantrys which have of late appeared in the streets. The extremely original gantry designed for the Kodak premises in Regent Street by Mr. George Walton, is one of the cleverest that has yet appeared in London, although hardly equal to the "Peacock hoarding" designed by the same artist. The gantry which has just been decorated outside Messrs. Gillow's premises in Oxford Street, from the designs of Mr. Frank Murray, is perhaps as pleasing as any; depending, as it does, solely upon the effect of stencilling an unbroken surface.

H. S. M.

ANTIQUARIAN LONDON.

A FAMOUS OLD PRIORY.

THE Bristol and Gloucestershire Archaeological Society has just concluded a week's tour of inspection of features of antiquarian interest in London. The fine old Church of St. Bartholomew the Great, Smithfield, was among the objects claiming attention. Mr. Aston Webb, architect to the Restoration Committee, gave some interesting facts, historical and architectural, concerning the old fabric. Mr. Webb said they were standing in a highly-favoured spot in London, as not so very long ago that part of the metropolis was covered by three great foundations, of one of which he proposed to speak. The priory where they were was founded by Rahere, who lived in the time of Henry I., and in a witty court he was considered one of the wittiest. Henry lost his son and heir in the White Ship, and this sad occurrence altered the whole character of the English Court, so that devotion took the place of pleasure, and Rahere changed his course of life. About 1120 he went on a pilgrimage to Rome, and the tradition ran that while in that city he caught a fever, and while recovering he undertook that if ever he returned to England he would

FOUND A HOSPITAL.

When convalescent he had a dream, in which he was carried into the air by an animal with eight legs which threatened to drop him into an unfathomable pit. As he was in this perilous position St. Bartholomew was supposed to have come to his assistance, and the saint told him that if he built a church he would recover. He agreed to build a church and hospital when he returned to London, the saint promising that God would inhabit the church and hallow and glorify it, and that His eye would be open and His ear attentive day and night to all souls, and that everyone who asked should receive a blessing. That blessing was believed by many pious persons in the parish to rest upon the church at the present time. Rahere fulfilled his promise, and a large space in Smithfield was granted to him. The hospital became great and flourishing, and over 150,000 people were every year relieved in sickness in St. Bartholomew's Hospital. Rahere joined the monks of the Augustinian order, and founded the church in which they were assembled. He lived to complete the portion of the church in which they stood, and became the first prior, continuing in office for thirty years. It was

THE OLDEST CHURCH IN LONDON;

the chapel at the Tower, which was hardly a church, being about fifty years older. Mr. Webb proceeded to describe the structure as Rahere had it carried out, and spoke of the different works which had been permitted to encroach upon the original holding, one of which was a fringe factory which overhung the altar. There was also a forge, and a transept was obscured by a covering of canvas. Fire destroyed some of the surroundings, but though they were burnt the structure of Rahere was left intact. Mr. Webb stated that when he was asked to take in hand the restoration it was agreed to purchase the factory and build a portion of the apse in the church. Directly they began to take down the plank wall which had been built at the east end, they found the tracing of the great windows which had been put in in the fourteenth century, and the original Roman triforium. Schools had been built on a portion of the spot occupied by the fringe factory. Then the forge was acquired and pulled down, and the south transept was erected. The stone used was of a character to tone down the

MAGNIFICENT ANCIENT WORK

against which it abutted. Mr. Webb pointed out a peculiarity in the structure, that pointed and circular arches, both of Norman date,

existed, and remarked that there were theories started concerning these features, but the matter was not satisfactorily settled. As there was considerable criticism passed on the restoration of old buildings, he might remark that they had not removed a single stone of the original work, and though a great deal had been done there, he mentioned that with some pride. They had no stained glass or other ornaments, though offers were made of them, as they desired to retain the severity and simplicity of the Norman work. At the close of Mr. Webb's address, the party proceeded to examine the different portions of the interior. The church, as seen to-day, is but a fragment of what was one of the largest monasteries in London. It consists of one bay of the original nave, constructed about 1150; a crossing above which once rose a lantern tower, destroyed in 1630; two shallow transepts, both re-built in recent times; a choir with ambulatory encircling its north and south sides and east end; and a Lady Chapel. The ground plan of the choir is now much the same as when completed in the middle of the 12th century, but the superstructure has passed through many changes. The present Perpendicular clerestory was substituted for the Norman clerestory; the roof also was taken down and the present high-pitched roof erected in its place. Side chapels were also constructed, of which little remains. On the south side of the church were the cloisters with the domestic buildings of the monastery clustered around them; in the east walk, the chapter house, dormitory and slype; on the west, the prior's lodging; and on the north, the frater or refectory, butteries and kitchen. The most interesting details in the choir and ambulatory are Rahere's tomb, erected in the 15th century, and Prior Bolton's oriel window, inserted in the south triforium, 1506-1532. The tombs of Robert Chamberlayne, 1615, with two angels drawing back the curtain of a tent in which the ambassador is kneeling in armour, of Rycroft, who edited the polyglot Bible, of James Rivers, with his bust and of Sir W. Mildmay, Chancellor of the Exchequer to Queen Elizabeth, and founder of Emmanuel College, Cambridge, are worthy of notice. When the party visited the Lady Chapel, Mr. Webb directed attention to the care taken in retaining old stone in the restoration. He also pointed out

A WINDOW STILL BLOCKED UP,

which, if a house adjoining could be secured, would be opened. He remarked that they had spent £17,000 in securing properties around the church, and about £33,000 had been spent on the last restoration. It was expensive securing property in the City of London. There is a beautiful iron screen at the entrance to the Lady Chapel, which was a memorial to a lady who was interested in the church. When they returned to the body of the church, Mr. Webb spoke of Rahere's tomb, with figures of two little angels reading a psalm, and angels at the foot holding the arms of the monastery of St. Bartholomew. The canopy work was of considerably later date. During the restoration in 1866 some workmen in the dinner hour improperly opened the tomb from the back, and then, without the consent of anyone in authority, opened the coffin. The remains of Rahere were disclosed as represented in the effigy on the tomb. The coffin was sealed up, and had never since been disturbed. Although the action of these men was wholly unauthorised, it settled the question of the remains being in the tomb. Before leaving, a large assortment of photographs was examined, and several purchases made, these souvenirs being sold to assist the restoration fund. An inspection of the

EXTERIOR OF THE CHURCH

was made, and in what was the nave several houses have been built, though, as Mr. Webb remarked, there is no chance of the nave being restored, since there is really no demand for it. The stone upon which sixpences were placed for old women to pick up was an object of some curiosity to the archaeologists. The church is approached from Smithfield through a pointed arch of the Early English period, with dog-tooth ornaments and four gracefully

moulded orders. This doorway probably led into the monastic enclosure. The way through the gate, after crossing a footpath, leads into the churchyard, on the south side of which may be seen the bases of Early English pillars. These formed part of the nave which once covered the whole space of the present churchyard.—Mr. G. B. Witts returned the thanks of the Society to the Rev. Sir Borradaile Savory and Mr. Aston Webb, and said if anyone wanted to know how to restore an old church he could not do better than come to St. Bartholomew's.—A move was next made to the Charterhouse. The party entered the hospital from the north side of Charterhouse Square, by a lofty doorway with overhanging shelf, supported by two lions. Opposite on entering is a brick gateway, part of the old monastery, to which was affixed a dismembered limb of the last prior, Houghton, put to death by Henry VIII. at Tyburn. The inner court on the right contains the master's house and the dining hall, now used by the pensioners, but once the Gueston Hall of the monastery, and later the banqueting hall of the Dukes of Northumberland and Norfolk.

THE GREAT STAIRCASE,

the minstrel's gallery, the governor's room, the great fireplace, were probably all the work of Thomas, Duke of Norfolk, who in 1565 bought the Charterhouse, and in 1572 was executed for treason, as was his predecessor, the Duke of Northumberland. Through a door in the east wall of the master's court is a cloister containing monuments to Thackeray, Leech, Sir Henry Havelock, and other old Carthusians. Thence entrance is afforded to Brook Hall, in which Brook, master of the hospital during the Commonwealth, was confined by Cromwell. Another door leads to the chapel, of which the entrance is ancient, the rest is Jacobean. Here is a monument to Edward Law, Lord Ellenborough, by Chantrey. The brick cloister of the monks extends along one side of the boys' playground; on another side are the modern buildings of the Merchant Taylors' School, which in 1872 superseded the old Charterhouse School. It was a peculiarity of the Carthusian system that the monks lived in separate houses, each having a little garden of his own. To the right, passing from the first court into the two new quadrangles, is Washouse Court, a portion of the old monastery. In 1361 Sir Walter Manny laid the

FOUNDATIONS OF A MONASTERY

for Carthusian monks on a piece of ground just outside the City boundaries, which had been previously used as a burial place for the victims of the plague in 1348. The name Charterhouse is an English corruption of the French Chartreuse. The chapel was consecrated in 1371. The monastery consisted of a large square, now the school playground, around which were some twenty-five separate houses or cells for the monks, the chapter-house, chapel, laundry, prior's lodging, and frater. The buildings passed through various hands, and brought death and misery to more than one of their proprietors, till Mr. Thomas Sutton purchased them of the Earl of Suffolk in 1611, and founded his hospital for eighty men and forty boys. In 1872 the Charterhouse School was removed to its new quarters at Godalming, where it has increased threefold. The vacant premises were bought by the Company of Merchant Taylors for their school, formerly located in Suffolk Lane, and the new buildings now accommodate 500 boys.

THE St. Luke's Vestry is being urged to lay a noiseless paving on the south side of Finsbury Square.

AN inquiry is being held with reference to the application made by the Liverpool Corporation to the Local Government Board for sanction to borrow £100,000 for the museum extension and new technical school.

SIR FREDERIC LEIGHTON'S house is opened to all comers on the Wednesdays and Saturdays of the present month, from eleven until seven o'clock. No less than 500 pictures have recently been added to the collection, already rich, upon the walls.

MELLIFONT ABBEY:

ITS HISTORY AND ARCHITECTURAL REMAINS.*

By ANTHONY SCOTT, M.S.A.

(Cor. Mem. Central Society of Architects, Belgium).

It will be very generally agreed, not only by the members of the architectural profession and the numerous archaeological societies now established, that, in the famous Abbey of Mellifont, Ireland, once possessed a gem of Mediæval Architecture. Its striking and beautiful design, intricate and costly workmanship, rendered it an object of valued possession, not only to the famous order of Cistercian Monks, its builders, but to the people of the surrounding kingdoms of Ireland. To-day, all that remains of this renowned establishment are the well-known ruins of the Abbey Church, the Chapter House, and some few fragments of the Monastic buildings.

The history of the Abbey, its foundation, rise, and fall, are inseparably bound up with the records of its founders, the Cistercians. To tell of the story of its establishment, the magnificent ceremonies of its consecration, the deeds of its abbots and brethren, would last far beyond the limits of this short paper.

Let us casually glance at some short facts relating to its bright foundation, glorious history, and subsequent abandonment to destruction. In the earlier part of the twelfth century an Irish Archbishop, St. Malachi, in the course of a Continental journey, paid a visit to the newly-established Abbey of Clairvaux,

situated in the diocese of Langres, in a lonely part of Normandy. St. Malachi, we are told, much admiring the discipline and rules of the new community, left four of his travelling companions there, to be instructed in the duties and observances of the religious profession, that, as he said, "hereafter they may be able to teach us." On his return to his See, some young men were sent to Clairvaux to join the others, and in 1140 or 1141 the erection of the new monastery was commenced at Mellifont ("The Honey Fountain") by the brethren who had returned to Ireland.

Among those who were left at Clairvaux to be instructed was one Christian O'Conarchy, an archdeacon of the diocese of Down, and who afterwards became first Abbot of Mellifont. When he returned to Ireland after his probation, as it were, at Clairvaux, he was accompanied by one Brother Robert, a skilled architect of French nationality, who is said to have built the Abbey after the model of Clairvaux. The grant of the site of the Abbey, together with timber and stone for its erection, was made to the monks by Donagh O'Carroll, Prince of Oriel, lord of the territory on which was the site of the monastery. This prince also endowed the monastery with "many broad acres."

In 1157 the Abbey was consecrated with much splendour and display. At this ceremony, we read, grants of much gold, lands, and gifts for the altar were made to the Abbey by the princes, lords, and great landowners there assembled to witness the consecration. Among those present at the consecration ceremonies was Devorgilla, Queen of Breffny, destined in after years to be known as the Helen of Ireland. According to some ancient historians, an intrigue with Dermot, King of Leinster, was the means of the first invasion of the English, with its well-known results. Beyond the fact that in 1173 Devorgilla again

visited the Abbey of Mellifont, but this time in the capacity of a penitent, and is said to have died twenty years later, there is nothing to chronicle.

From the date of its consecration, for well nigh 400 years, Mellifont Abbey flourished in the seclusion of its quiet valley, sending out brethren (as the parent house grew too small) to found other houses. In this way were founded the numerous Cistercian Abbeys throughout Ireland, all of which were subject to the parent house at Mellifont, and were governed by its abbot.

So early as nine years after its own establishment Mellifont reckoned six important filiations or branch houses, namely, Bective, co. Meath; Newry, co. Down; Boyle, co. Roscommon; Athlone, Baltinglas, co. Wicklow; and Manisterray, co. Limerick. At the time of the English occupation twenty-five abbeys were in existence, spread over the whole of Ireland, each erected in a valley by the side of a running stream, and removed from the borders of great cities.

Passing over the 400 years which elapsed since its consecration, during which period no event bearing on the Architecture of the Abbey is chronicled, the next important date we find is the memorable year 1539. Just previous to this year Henry VIII. and his Parliament had passed the Acts for the suppression of monasteries.

It may here be mentioned that the suppression of the monasteries was repugnant to the inhabitants of the country, even to the Government officials of the large cities. A protest against the dissolution (but which was, unfortunately, without effect) was addressed to the King and his secretary. In it the writers drew attention to the fact that the Cistercian Monasteries were the only inns throughout the country. Those inns possessed the additional merit of being free of all expense to visitors. Another reason why the writers of this protest wished for the retainment of the abbeys was that they formed the only schools or seminaries available for the children of the nobility. As is well known, these Acts were at first directed only towards the lesser monasteries. These unfortunate establishments having been delivered to the Royal Commissioners, their valuable possessions realised so much that the larger monasteries were soon ordered to be suppressed, and their estates confiscated. In obedience, therefore, to the monarch's mandate, the Abbot and monks of Mellifont assembled in their Chapter House one bright day in July, 1539, and there, in the presence of the Commissioners, the unfortunate brethren delivered up their all. Having signed the fatal document, they were expelled from their house and church, and left to roam where they might.

Immediately after the surrender a sale by auction was commenced, when everything of value was disposed of to any bidder. The woodwork, stained glass, all the costly fittings and furniture, were there and then sold; if not sold, smashed into pieces; and, it is said, even the graves of the dead were not spared.

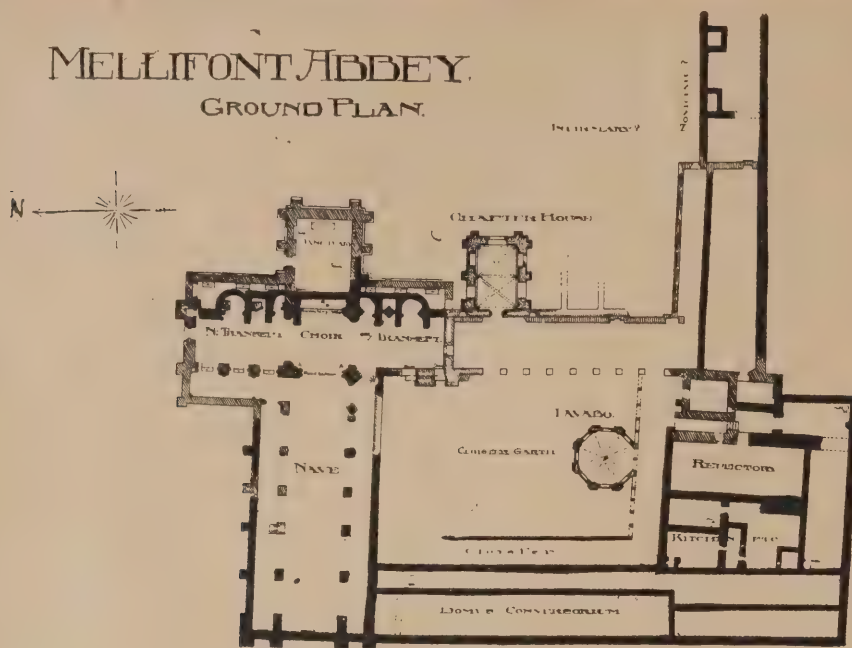

The records and muniments of the monastery were greedily seized upon as giving a correct account of all the property belonging to the Abbey, and the situation of its various and scattered possessions. Thus it is that so fragmentary particulars of the history of the Abbey have come down to us. It was only by purest accident or extraordinary means that any of the archives of these monasteries are yet extant. All were confiscated by the regal emissaries, and, of course, by them consigned to oblivion or flames when once their purpose had been served. Of the monks expelled, but fourteen, including the abbot, received pensions, all of small amounts. To the others nothing but a small monetary grant was allowed.

In 1541, the Abbey, with all its possessions and lands, its revenues, rights of patronage, &c., was given to one Laurence Townley. In 1556, they passed into the hands of Edward Moore. Under this owner the Abbey was converted into a residence, and strongly fortified to resist invasion by the Ulster Irish. This Edward Moore, knighted soon after his possession of the Abbey, was succeeded by his

MELLIFONT ABBEY. THE PORTER'S LODGE. FROM A CHARCOAL DRAWING BY ANTHONY SCOTT.

MELLIFONT ABBEY. GROUND PLAN.

son, Sir Garrett Moore, who also obtained the revenues, &c., of six other dissolved monasteries.

In 1641, Lord Charles Moore, the son of Sir Garrett, who had been raised to the peerage, became involved in the civil wars of that period, during which eventful time the Abbey was besieged, stormed, and sacked on more than one occasion.

At the close of the Civil War, Lord Moore's son, finding that his income, which had been reduced under the Government of the Commonwealth, was insufficient to support his various establishments, obtained—after petitioning the Government of the day—entire possession of Mellifont Abbey and 300 acres of land for his own support.

With the fifth Lord Moore, who had received also the title of Earl of Drogheda, this portion of Mellifont's history closes, for in 1727 the seat of the family was established at Monasterevan, in the county of Kildare, and Mellifont was abandoned for ever.

Soon the progress of decay became very evident; the roofs and walls fell, rubbish and debris accumulated, until nearly all was covered by the green turf growing on 5ft. to 9ft. of rubbish. About 100 years ago the mill we see at present was erected, to serve which the old avenue passing through the gateway at the porter's lodge was turned into a mill race, and the present road (formed on the accumulated heap of ruins) constructed to give access to the mill.

This seems to have been the lowest state of degradation to which the Abbey was destined. The mill continued working until about thirty years ago, when even it was left to ruin for years. Thus the Abbey of the "Honey Fountain," the great monastery, as the people of the surrounding country knew it, has remained for more than a century and a half given over to decay, each season as it passed doing its work of wreck and ruin silently, but yet as effectively as the siege and storm of battle. At last came a brighter day for Mellifont, for in 1884 the Abbey was vested as a national monument in the Board of Works, under the Acts of 1869.

In the course of the necessary repairs to the old structure then carried out, traces of walls and pillars were discovered. Further excavation led to the whole of the ruins as they now are seen being exposed to view. At this time the old offices belonging to the mill were removed. These works were carried out under the capable superintendence of Sir Thomas Deane, and effected a great change in the appearance of the site of the old Abbey. Where once only appeared an enormous rubbish heap, strewn over with scattered pieces of wrought stone, a greater part of the buildings may now be distinctly traced. The tops of the stump of the piers and walls were

covered with a waterproof concrete, and the fragments of the old wrought and carved stone, tiles, and brick, &c., collected and stored in the Chapter House, to be the admiration and wonder of the strolling visitor or the interested architect.

Leaving the history of the venerable ruins with all their melancholy associations, let us now turn to a somewhat closer examination of the existing remains.

We have noticed how that Brother Robert is said to have built the Abbey of Mellifont, after the model of Clairvaux; this we shall see to be true, only as far as relates to the disposition and arrangement of the various blocks of buildings, which are component parts of the whole Abbey. Local circumstances of course dictated the precise method of arrangements and of the details of the monastery.

By one of the earliest rules of the Order, the site for each new abbey was to be sought for in a sheltered valley close beside a running stream or river. The monks were to strictly avoid the choice of sites on elevated positions, and were also forbidden the erection of lofty towers.

If we examine the plan of the parent house of Clairvaux, a lonely, out of the way part of Normandy, and compare it with its offshoot, that of Mellifont, a sort of family likeness is at once evident. In both, the buildings are arranged round a quadrangle or inner court, with the church facing east, forming the north side. The eastern side comprised the Chapter House, Sacristy, Parlour, and other apartments, which may be described as the administrative block. The western block (which at Mellifont runs along the river bank), contained the Domus Conversori, the house of the Lay Brethren, and the square was completed and the quadrangle enclosed by the dwellings and dormitories of the fully professed monks. Round the walls of the inner court or quadrangle ran the cloister, which well-known feature was usually one of the more decorated portions of the monastery.

A high wall enclosed the monastic buildings and gardens, the space within often amounting to fifteen or sixteen acres. The avenue from the main quadrangular block of buildings led up to the porter's lodge, through which a spacious archway formed the means of ingress and egress to the monastery. The gate lodge was in charge of an experienced lay brother, who was, as it were, the connecting link between the monks and the outer world. The avenue or road from the porter's lodge to the monastery proper was lined on each side with buildings intended for the shelter of travellers, who sought the hospitality of the monks, for, as we have before remarked, to all who asked the inhabitants of Cistercian abbeys were (by one of their distinguishing rules and customs)

to give food, lodging, and rest to all wayfarers, of whatever condition or plight. Here the points of similarity between the two examples cease. In the details of the arrangements of each abbey we should find, as we have already discovered, that local circumstances dictated the precise minor arrangements.

We will, therefore, now proceed to examine what is left of our noted Abbey of Mellifont in fuller detail. But before we examine the Architecture of our ancient Abbey, let us first see what are the materials with which the monks erected their buildings. For general walling they used the green clay slate stone of the adjoining hills. The walls, of ordinary uncoursed rubble, are well built, but of no extraordinary thickness. In some parts of the walls are to be seen blocks of concrete, evidently composed of lime and a rather fine gravel. Whether these were built in by the original builders we cannot know.

The dressings and wrought stone work generally are of yellowish sandstone, evidently of a good weathering nature. There is no similar stone to this found in the near vicinity of Mellifont. The nearest deposits of such sandstone are to be found at Johnstown and Skryne, near Navan, co. Meath. These may have been the quarries from whence it was obtained. Some of the more intricate carvings are worked out of Caen stone, or some such similar stone, which has slightly decayed in parts, and in some places has been deliberately defaced or chipped.

With what materials the roofs of the buildings were covered we can hardly now ascertain. The laminated stone of the locality is capable of being split very finely, and may possibly have been used for slating the roofs, as we know that some of the abbeys and churches in like districts were similarly covered. The old records and chronicles, fragmentary though they be, tells us that the Cistercians were the first brickmakers in Ireland. That this statement is very true the existence of a thin, well shaped brick of a light red colour in some of the later buildings at Mellifont is ample proof.

Among the collected fragments in the Chapter House are to be seen some examples of ridge tiles, of red terra-cotta glazed on the outside. These tiles are heavy and of large size. In section they are of the ordinary crested pattern and are ornamented with tool marks. Moulded brickwork, slightly glazed, was also used by the monks, as we shall presently discover, but the article in which they appear to have most excelled were floor tiles. A large number of these are at present laid as a floor in the Chapter House. Each tile measures about 5in. by 5in., and is about $\frac{1}{4}$ in. thick. Some of the tiles have the pattern stamped on them or incised; others are encaustic, the principal colours being red and cream.

A few of these tiles still remain in their original position, thus indicating the original floor level. They are to be found in a corner of one of the piers at the crossing of the nave and the transepts of the church. From the level of these we may notice what vast accumulation of rubbish and debris once must have covered the abbey before the excavations of 1884. The apparent ground level then was above the tops of the stumps of the remaining piers and walls.

Let us now turn to the architectural treatment which the ruins display. Of the church and buildings first erected by the monks in 1142-1157, but little is remaining. A close examination of the ruins show the traces of the foundations of an early church intermingled with the walls and piers of the eastern end of the later church. The earlier church had in all probability a circular apsidal east end, with small chapels in a line with the apse. In this respect the early church corresponded with that of the church in the Abbey of Clairvaux. Shortly after the erection of the Mellifont Monastery, the monks at Clairvaux carried out extensive alterations to their church, and remodelled it to a great degree.

Acting in conformity to the superior house, the Mellifont monks probably altered their church to keep up with the amount of architectural knowledge then obtained. They,

however, built a square east end to their new sanctuary, in this respect departing from the customary Cistercian plan, recurring, however, to the earlier church, which was, as far as can be gathered, of a Norman character. It is doubtful if many of the fragments of the stonework stored in the Chapter House formed part of its architectural treatment. There was nothing about these caps of more than ordinary character. They were, in fact, but of a very usual type of Norman work.

We have said that but little is left of the monastery or church buildings first erected at Mellifont, and it is improbable that any of the remains of the monks' apartments date from that early period. These buildings, such as the refectory, calefactory, kitchens, and the novitiate, sectorium, and infirmary, which had over them the dormitories, are now represented only by their fragmentary traces. Except some few feet of foundations and two small vaulted apartments, no trace is left. While of the guests' chambers, stables, stores, which, tradition has it, once lined on both sides the avenue, from the large quadrangular block up to the porter's lodge, not a vestige is to be seen.

The porter's lodge, of which very considerable part remains, possesses a massive and dignified appearance, but has no very striking architectural features. The arched gateway is covered with a semicircular barrel vault of unhewn stones. The walls are very massive, are built of the common slaty stone of the surrounding hills, with squared quoins of sandstone. This lodge was in the charge of a lay brother, who could watch all entries to the Abbey. There were two stories over the gateway with rooms, it may be supposed, for the gatekeeper.

In the absence of well-defined periods of architectural style among the ruins, and the uncertainty of chronological sequence at Mellifont, we shall next examine some later Norman caps, some of which may be said to be of the Norman Transitional period. Where these examples originally stood cannot be said with any degree of certainty. The eastern walk of the cloister at Mellifont was probably the place where were used details of this style, but no information may be gathered from the site itself. In all these examples are large holes for dowels, which, in some cases, perforate the whole of the base stones.

Most of these capitals are in a remarkably good state of preservation. It is very easily to be seen that to violence alone is attributable the damaged condition of some of them. Here is a line graved upon the abacus of the cap for setting out the profile of the lobes; here is another, with fainter traces of the same lining.

Careful setting out and delicate workmanship are exhibited by all these examples, the leaves being in each case skilfully wrought and tenderly handled, and each example is rather more symmetrical than we generally find in works of this period.

The later church, which we have already seen was built upon the site of the earlier church, and occupies the same relative position here as at Clairvaux, and also at Villers, in Belgium, now claims our attention. Its plan, and such details as are left us, evince traces of some changes of style. Perhaps these changes were improvements or alterations to make the church still more beautiful and sumptuous as the monks advanced in architectural skill and knowledge.

Tradition does not relate the name of any of the architects under whom these changes were adopted and executed; neither has the name of the abbot, during whose tenure they were carried out, come down to us.

Here we have a cruciform church, with aisled naves and transepts, with a square-ended sanctuary. This square-ended sanctuary, which differs in this termination so strongly from the Continental examples of Cistercian churches, was probably inserted because of the prevalence of such square ends to English and Irish churches. At one period of its history no Irishman was permitted to enter Mellifont either as a lay brother or fully professed monk. This was probably the period during which the square termination was built to the church.

(To be continued.)

Bells and Carillons—Old and New.

THERE is an ancient Latin proverb which asserts somewhat decisively that the tastes of human kind are matters regarding which it is worse than idle to quarrel. And this will hold good with equal force of matters musical, for among the musical instruments which are pronouncedly loved or hated the bell without doubt takes a foremost place. One poet speaks with delight of "those evening bells," and another of the "bells of Shandon;" but how many men who are not poets, and who cannot rhapsodise, unless it be in bad language, have cursed those Sunday bells? But, quitting the poets, made and otherwise, it would appear that the love of bells is almost a national trait in the Englishman's character, for England has ever been known for

ITS LOVE OF BELLS.

even being in ancient days sometimes termed "the ringing island." And here it may be remarked that, although the bell may appear a somewhat simple musical apparatus, it was only by very slow degrees that it reached an approximate perfection, even if this stage can be said to have been attained. Bell founding is an art which requires very considerable skill, although the present day process varies very little from that pursued in ancient times; but with the process of founding we have no concern here, although we may mention that the most anxious moment for the founder is when the mould is *in situ*, and the bell metal has been found to be of the right temperature, and the furnace doors, wherein the molten metal is confined, are opened; when the workman, if he knows his Schiller, thinks of his glorious "Song of the Bell" thus:

Is the bell in the ground well bedded?
Is the mould well set and steadied?
Skill and diligence to pay,
Will it issue fair to-day?
Should the cast not hit,
Should the coping split!
Ah! perhaps, while hopes elate us,
Now, e'en now, mishaps await us.

As England has ever been famous for peal and change ringing, so Belgium, especially among Continental countries, has always been noted

for its carillons, which is to be found generally throughout the Netherlands and in Germany and other places. Speaking of the *carillon*, Dr. Engel tells us that "it is generally placed in the church tower, and also sometimes in other public edifices." The statement repeated by several writers that the first carillon was invented in the year 1481, in the town of Alost, is not to be trusted, for the town of Bruges claims to have possessed similar chimes in the year 1300. There are two kinds of carillons in use on the Continent, namely, the clock chimes, and those with a keyboard, manipulated by a musician. The carillon in the Parochial Church at Berlin, which is one of the finest in Germany, contains thirty-seven bells, covering rather more than three octaves, while the new one of our own Royal Exchange stands forth as one of the best in the world. Reverting to the metropolis of London, it may be mentioned that Dugdale tells that a "clochier," or bell tower, stood at the angle of the east end of the churchyard of old St. Paul's Cathedral, which contained "four very great bells, called 'Jesus Bells,' in regard they specially belonged to Jesus Chapel, situate at the east end of the undercroft (crypt) of Paul's." He also relates that these bells were in existence until the time of Henry VIII., when a certain Sir Miles Partridge, "having

WON THEM FROM THE KING

at one cast of the dice, pulled them down." Whether these were the only bells possessed by old St. Paul's Cathedral may be doubted. If a peal ever existed in the central tower of the church, it must have been destroyed by the fire which burnt the tower in 1444 or in 1561, and as no mention is made by Dugdale of bells being placed in the tower after the restoration of the edifice by Queen Elizabeth, it is probable the cathedral had none. The finest bells in London are those of St. Paul's Cathedral, which number twelve, and total in weight 271cwt. 3qr. 11lb., and those of St. Saviour's, Southwark, while the best carillon is, as before stated, that of the Royal Exchange. Other good peals of bells and chimes are to be found at St. Martin-in-the-Fields, St. Clement Danes, and Whitechapel.

MELLIFONT ABBEY: A CORNER IN THE CHAPTER HOUSE. FROM A CHARCOAL DRAWING BY ANTHONY SCOTT.

ACADEMY ARCHITECTURE.

BY A SPECIAL CORRESPONDENT.

(Continued from page 395.)

MR. BRYDON exhibits the Art Gallery and Library, Bath, designed in the refined classic for which he is so justly famous. Mr. Horace Field's well designed Georgian building, the General Offices of the North-Eastern Railway at York, is an imposing and picturesque block, and should make a fine addition to the modern Architecture of York, as well as to railway Architecture in general. It is indeed quite a treat to at last see something good in railway buildings. Mr. H. T. Hare shows, in a very effective drawing by Mr. Raffles Davison, the Public Library at Shoreditch, a building of later Renaissance character, with a great breadth of effect. A kind of tower over the entrance doorway has a pyramidal room with a circular turret, corbelled out, and finishing with an octagonal ogee roof, just clearing the main roof.

The domestic work this year is quite as good as on former occasions. Amongst the smaller

must ascribe to the love of quaint effect shown by Mr. Wood.

Messrs. Brewill and Baily show a new house at Edwalton, a Georgian design, the angles of the building being marked by Ionic pilasters. The entrance gable can hardly be said to be elegant, but with this exception the design is pleasing. Mr. Leonard Stokes, in Nos. 1720 and 1724, exhibits Shooters Hill House, Pangbourne, illustrated by vigorous pastel drawings by Mr. E. A. Rickards. This method of illustration is somewhat novel at the Academy, but it is an exceedingly effective one for buildings. The picture gallery of Shooters Hill shows a long, interesting looking room with a curved ceiling, top-lit, the fireplace recessed back has a small apartment over, which gives a very quaint and very effective appearance to the room.

Messrs. Ernest George and Yeats have only two exhibits this year—The Library, North Myms (1608); the fireplace, Jacobean in detail, is surmounted by an enriched frieze, the bookshelves coming up to the fireplace on both sides; a pair of fire-dogs and fireback complete the design. The other exhibit, "Okewood, Sussex," for her Grace the Duchess of Santo Teodoro, is a brick building, consisting of a main block with two wings, which

rather French in feeling, the ceiling is formed of massive timber beams, the room is panelled throughout up to the height of the frieze. The views of the staircase show a rather original treatment in the use of a handrail, this being stepped. The decorations on the staircase are Adams in character.

Mr. C. F. A. Voysey has two exhibits, both houses in white plaster with green slate roofs, an effect which when introduced a few years since was a novelty, but we are not quite sure that the extreme plainness and disuse of all mouldings will not soon pall on the public; the use of rough-cast even now threatens to degenerate into a fashion.

Mr. Henry T. Hare exhibits "The Old White House, Oxford," a simple piece of domestic work charmingly drawn by Mr. Mallows, certainly one of the most successful drawings of the year. The upper part of the building is rough-cast; the lower part of stone; the centre front is broken by a projecting square bay with gable roof under which is the principal entrance to the inn.

Mr. Arnold B. Mitchell's "House at Milford on Sea" (1597) is a very effective brown ink drawing, and has a plan. The entrance porch which appears in the perspective leads into a spacious hall larger than those usually

A SKETCH AT THE ROYAL ACADEMY.

work there are no exhibits of more interest than those of Mr. Edgar Wood, of Manchester, who has no less than six exhibits. Nos. 1600 and 1765—houses and shop at Middleton, Lancashire—are apparently different views of the same building, a very quaint design, the corner shop with its circular bow window on the first floor, and two circular windows on the ground floor, making a particularly effective group. Mr. Edgar Wood in many of his buildings makes use of plaster work as a decorative means, and here uses it in upright bands, and in little panels round the bay window. Nos. 1675, 1876, also by Mr. Wood, show a country house, the upper part being of rough-cast, the lower brickwork, the roof is apparently of stone slates; the formal water-colour drawings admirably illustrate Mr. Wood's work, indeed, it is the drawing of all his work which so much helps to bring out the homely and unaffected picturesqueness. No. 1792, "The Friendship Inn," is a water-colour drawing, though to our mind, not quite equal to Mr. Wood's other work.

No. 1667 looks more like an old country inn than a newly erected one, but this we

enclose a forecourt. One wing is extended to form a terrace front. A picturesque feature is the entrance archway to the left of the forecourt, otherwise the design has no very striking features; but the fact of its being from the hands of Messrs. E. George and Yeats would insure an interesting result. The New Dames Houses, Wycombe Abbey School, by Mr. W. D. Caröe, can hardly be said to be amongst his best work. The multiplicity of windows tends to make the design look fidgetty and restless. The drawing by Mallows, in pencil, is pleasing. Mr. Caröe also exhibits "The Tower of Saint Michael's, Woolwich" (1706).

One of the most interesting domestic exhibits is Jardine Hall, an old Scottish house, to which Mr. E. J. May has made extensive additions, including an entire remodelling of the plan. The drawings show a general view of the exterior, the spacious entrance porch, the dining room, and the staircase, as well as one or two other portions of the house, which, as thus altered, forms one of the most successful examples of recent domestic Architecture. The dining room has a handsome stone fireplace, extending to the ceiling. It is

found in houses of this type, but this is certainly a good way of treating a moderately sized house. The dining and drawing rooms, library and billiard rooms, are all entered off the hall.

Mr. W. A. Pite shows a frame of three clever pencil drawings of Highcombe Edge, Hindhead (1730), all interior views.

Mr. T. Davison's cottage hospital, No. 1621, is a very successful little design, this class of building is always rendered difficult to design, owing to the many requirements, often amounting to fads, on the part of the doctors, but Mr. Davison seems to have been able to successfully surmount them in his design, and has succeeded in getting a picturesque building.

We are glad to note a new and original attempt at a modern house front in Mr. Cave's "40, James' Street, London" (1634). The pencil elevation is tinted to indicate a green brick front, with a white-painted projecting bay running up through three stories in the centre, with a cornice at the top, above which is a light-coloured stone gable very plainly treated; on either side of the upper

HOUSE AND SHOP :
MIDDLETON LANCs :
EDGAR WOOD ARCHT :

A SKETCH AT THE ROYAL ACADEMY.

part of the bay is a panel in bas-relief. Altogether this is a very pleasing exhibit, and the green brick treatment should be especially suitable for the London atmosphere.

Mr. H. Inigo Triggs exhibits a golf club house, a design in stone, with stone slate roof. The design consists of a single story block of buildings, in front of which is a verandah, whilst behind rises a low, square tower, with octagonal turret; a sculptured shield and a sundial occupy panels at the foot of the principal gable. The building is shown in a conventional drawing by the author.

Mr. Halsey Ricardo's house near Bramley is a long, low building with mullioned windows, and looks like a reproduction of a late Gothic country house.

The "House at Edgbaston, Birmingham," by Messrs. Bateman and Bateman, shows a building probably more antiquated than in reality, but it is nevertheless a very pretty piece of colour.

Mr. Inigo Thomas has two exhibits, both colour drawings rather dark in tone. "The New Playing Fields, Eton" (1641), is a bird's-eye view showing the fields laid out much after the style of Hampton Court, with long avenues between the fields. It will doubtless be many years before the scheme will attain the maturity shown in the drawing, but, should the idea be carried out, the Eton of a century hence will have much to be proud of. Mr. Thomas's other contribution is one in which great importance appears to have been attached to the border, which almost obscures the drawing.

Nos. 1664 and 1674 are two drawings of a cottage by Mr. L. F. Crane, identical in all respects except that one has a slate and the other a tile roof.

No. 1677, "The Court House, Broadway, Worcestershire," is a stone building designed on local lines, and will certainly be an acquisition to the delightful Worcestershire village. Mr. H. T. Buckland's "Roadside Inn at Bromford" is a quaint, straggling building, well illustrated by a watercolour drawing.

No. 1685, "The Rhodan School," by Mr. John W. Simpson, is one of the most interesting designs in the room. The buildings, which run round three sides of a square, are so arranged that the masters' houses are on the front portion of each return wing, whilst the schoolhouse is at the back of the quadrangle. The design is

c c c 2

well illustrated by a broad and delicate drawing by Raffles Davison.

Mr. James A. Morris exhibits "The Garden and Proposed Addition to Red House, Ayr" (1692), illustrated by an effective pen drawing by Mr. MacGibbon, the design is essentially Scotch, and, we are inclined to think, a little too formal. The gardens, if carried out as shown, should be very effective.

No. 1708 shows two red brick villas, simple but well-proportioned, and a decided improvement on the usual types; they are by Messrs. Brewill and Bailey.

No. 1768, "A House at Pangbourne," we are afraid is rather spoilt by the drawing; there are two other drawings of this house: 1752, "The Entrance Hall;" 1753, "The Garden Front." In 1752 we have such a charming entrance hall that we may forget the exterior of the building in contemplation of the vaulted chamber with its strapwork ornament shown so broadly and sympathetically in the drawing by Mr. J. J. Joass.

We should have liked to have seen more than one exhibit from Mr. C. Harrison Townsend. "Cliff Towers," however, well sustains his reputation. It is a country house on the Devonshire coast, perhaps suggestive of American domestic Architecture. The basement is of heavy stonework, the ground floor of ashlar, the remainder of the building being green slate. The circular hood over the front door is a pleasing feature, the door itself is apparently covered with metal plates.

Yarmouth, Isle of Wight, should certainly be much the richer for the picturesque group of buildings Mr. Aston Webb has designed consisting of a small club facing the water-

ENTRANCE FRONT
"CLIFF TOWERS"
C. HARRISON TOWNSEND ARCHT

A SKETCH AT THE ROYAL ACADEMY.

and a row of shops at right angles to the club's principal front.

No. 1781, "Three Houses at Hampstead," by Mr. Horace Field, is a quiet Georgian design. With the exception of the entrances, almost entirely devoid of stone dressing, this is surely as it should be in a brick building.

Mr. M. H. Baillie Scott exhibits (1787) "A Proposed House at Bexley." This is a pleasing half-timber and rough-cast elevation, the timber being used sparingly.

There are not many churches exhibited this year. In No. 1601, "Design for New Church, Caerhŷn, Conway," Mr. H. L. North shows, in small coloured geometrical drawings, a country church, proposed to be built of local granite and Penmon stone.

No. 1635 is another Welsh church, attractively drawn. No. 1643 is a design for a church tower by Mr. J. Coates Carter, very French in appearance. Mr. A. H. Skipworth has two church designs. No. 1668 is a good bold design and drawing of a country church on a hill by Mr. Edwin F. Reynolds. No. 1686 is a very successful design for a country church on a hillside, shown in an excellent pen drawing, which, if we mistake not, is by Mr. Needham Wilson.

Mr. S. K. Greenslade exhibits a design for a town church, a small drawing, but exceedingly well done; the design itself is apparently on a large scale.

COLLEGE BUILDINGS IN LIVERPOOL.

THE new Pupil Teachers' College, Clarence Street, Liverpool, has been formally opened. The college has frontage to Clarence Street and Pleasant Street. The main elevations are executed in buff terra-cotta and pink brick of specially selected tints. The style of Architecture adopted may be described as a free treatment of English Renaissance, dominated largely by the requirements of modern education. Adjoining the college in Clarence Street is the principal's residence, now in course of erection. The class-room accommodation provided is for 569 students on the ground and first floors. This is exclusive of the science department, which, with the art class-room, occupies the whole of the top or second floor. The lowest floor is a half basement.

ONE STAIRCASE

is provided for the female pupil teachers, connecting the whole of the four floors, and another staircase from Green Lane; a side street is provided for the male pupil teachers, also connecting the four floors, and giving access to their lavatories and cloak-rooms. The class-rooms accommodate from thirty-five to sixty students each, and two pairs of accommodating rooms of fifty each can be thrown together by sliding glass partitions. The science department, which occupies the top or second floor, as already stated, contains a chemical laboratory, giving accommodation for forty-eight students, with storage and preparation rooms, balance room, and science teachers' room in connection therewith. There is also a lecture and examination room, divisible by a roller screen.

THE ART CLASS-ROOM

is 37ft. by 23ft. An office for the principal commands the entrance from Pleasant Street. Special attention has been paid to lighting, heating, and ventilation. The artificial lighting is by electric incandescent lamps, suspended in clusters of three. The rooms are heated by hot-water pipes, and the corridors by means of radiators on the low-pressure system. Open fireplaces are also provided. A natural system of ventilation has been adopted, fresh air being admitted at the meeting rails of the windows, with other forms of inlet where required. Extraction is obtained by means of large air flues and roof extractors. The buildings have been designed and erected under the supervision of Messrs. T. Mellard Reade and Son, architects, 2, South John Street, Liverpool, and the work has been carried out by the late Mr. Samuel Webster, Bootle. The contract price for the building was £14,327.

NEW THEATRE AT PLYMOUTH.

THE imposing structure in Union Street, Plymouth, known as the New Palace Theatre, is rapidly approaching completion. Together with the adjoining Great Western Hotel, the block has 125ft. of frontage and is 140ft. feet in depth. The theatre has been in course of construction about thirteen months, and 220 men are now employed in putting the finishing touches to what will be one of the largest and best-appointed music-halls in this part of the country. It has been erected from the designs of Mr. W. H. Arber (Wimperis and Arber), 25, Sackville Street, Piccadilly, W., and will contain seating accommodation for over 2000 persons. The commanding front has been executed in plain and glazed terra-cotta by Doulton and Co., Lambeth, a special and most interesting feature being the reproduction on tiles of the two celebrated pictures of the Spanish Armada, in its glory and in its defeat, by Sir Oswald Brierly. These pictures are in

TWO LARGE SEMI-CIRCULAR PANELS,

one at either end of the main façade. From the principal front entrance in Union Street a wide Sicilian marble staircase leads to the spacious balcony and foyers, and the stalls may be approached from the same entrance by a subway. The building has been designed on the most modern principles. The foyer on the first floor of the balcony level is to be very handsomely finished, and the boxes and balcony stalls will be upholstered in velvet. The balcony and gallery fronts, and also the fronts of the boxes, are artistically carved in fibrous plaster work of special designs. There will be two tiers of seats and a spacious promenade. The decoration of the interior is thoroughly English in character, and the panels in the large central dome, the friezes, and the balcony fronts are rendered attractive by a series of paintings of naval and military triumphs and incidents of local as well as national interest. The pictures in four large

PANELS OF THE DOME.

represent the destruction of the "invincible" Armada, the battle of Trafalgar, Admiral Blake's victory over Van Tromp, and Lord Howe's brilliant naval success; and those in the four smaller panels comprise the Great Harry, the first English warship, built by Henry VIII.; the Victory, Nelson's flagship, as she appeared when under his command; the Santa Maria, in which Christopher Columbus discovered America; and, by way of effective comparison, H.M.S. Majestic, one of the latest types of battleships. Over the proscenium arch is an exceedingly good picture of Sir Francis Drake being knighted by Queen Elizabeth, together with portraits of other famous personages of that period, including Howard, Essex, Raleigh, Frobisher, Seymour, Shakespeare, Sidney, Spencer, Bacon, Marlowe, Leicester, Amy Robsart, and Mary, Queen of Scots. On the ceiling over the proscenium arch is a picture of the battle off Cape St. Vincent, and paintings representative of the goddesses of peace and war. Each side of the proscenium contains scroll panels bearing the names of prominent Elizabethan heroes with an Elizabethan ship at either end. There is also round the balcony and gallery tiers a series of heads of renowned naval and military men, ancient and modern. Prepared for the entrance hall is a picture of the meeting between Wellington and Blucher after Waterloo, and another of the battle of Cressy, together with a series of small panels containing representations of the vessels in which William the Conqueror came over to England. The whole of these decorations have been executed

FROM OLD PICTURES AND SKETCHES

of the period, and were painted on canvas in London studios by Mr. W. H. C. Brewer, of London. In the erection of the theatre the safety of the public has been specially studied. The stage is fitted with one of Merryweather and Co.'s fireproof curtains, and a number of hydrants are fixed in the most suitable spots around the building. There are ample means

of entrance and exit at all parts of the building, including 5ft. staircases leading to and from the gallery, in addition to similar staircases to the balcony. The specially-arranged ventilation is most complete. Over the central dome is a huge ventilator, and there are also ventilating shafts carried out from the ground floor level in the spandrels of the auditorium; whilst provision has been made for the entire removal, during the intervals in the performance, of a large glass roof in the gallery, thereby securing an open space about 16ft. by 10ft. There is ample lavatory accommodation, and the refreshment bars are conveniently placed. The theatre will be illuminated by the electric light. The Great Western Hotel is being rebuilt so as to form one façade with the theatre.

KEYSTONES.

A SCHEME has been adopted for the erection of a new Presbyterian church hall in Leeds.

The foundation stone has been laid of the new Presbyterian Church at Harehill Avenue, Leeds.

Three stained glass windows, erected in the Parish Church of Beaconsfield, have been unveiled.

The Church of St. James the Great, Bethnal Green Road, E., is now being restored. It had been allowed to fall into decay.

A NEW Masonic Hall in Carrickfergus was dedicated a few days ago. Mr. S. P. Close is the architect, and Mr. Ezekiel Caters the builder.

The necessity for enlarging the wholesale fruit and vegetable market, at Smithfield, is being considered by the Markets and Fairs Committee.

The foundation-stone of a Roman Catholic Church at Brockley has been laid. The new building will cost rather more than £3000, and will have seating accommodation for 600 persons.

The Leamington Town Council has resolved to at once proceed with the erection of a building for the joint accommodation of the technical school and free library, at a cost of £12,000, exclusive of land and furnishing. The design is to be thrown open to competition.

PLANS have been approved for the new Old Bailey, and in the near future we may look to have our criminals dealt with in a more convenient place than the present building, which is totally unworthy of the important part which law-breakers take in the life of the City.

THE handsome premises of the Church Training College for Lay Workers, in Commercial Road, Stepney, established and maintained by the Society for Promoting Christian Knowledge, were opened last week. The site of the new building cost £5000, while the structure itself cost £10,000.

A MEMORIAL to Edmund Burke has been placed in the parish church of St. Mary and All Saints, Beaconsfield, Bucks. The place given it is about the centre of the wall in the north aisle. In design it is a handsome tablet. The head, carved in Derby alabaster, is copied from the portrait by Sir Joshua Reynolds, painted in 1775, now in the National Portrait Gallery.

THE West of England Eye Infirmary Governors met at Exeter to consider a recommendation of the Building Committee. The amount of donations and promises to the Building Fund now amount to about £6600, and the committee, seeing the urgent need for extra accommodation, consider that the first section of the new works, which it is estimated will cost £13,000, should be commenced in August.

THE London and North Western Bill for the construction of the proposed tunnel under Shap Fells passed unopposed through Committee of the House of Commons on Monday week. The length of new line authorised between Tebay and Shap runs altogether to between nine and ten miles. A noteworthy point in the particulars is that the Company takes power to abandon the old line over the fells, which now connects Tebay with Shap. This does not imply that any existing station will be disused or any new station created.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

July 20th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slat; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

An interesting discovery is reported from Ruabon, where excavations are proceeding in the old Bryn Fields. The workmen in cutting a deep trench unearthed a kind of cistern, consisting of two upright stones, surmounted with a cross-stone, which inclosed a large sepulchral urn of terra-cotta, containing cremated remains. The urn is bowl-shaped, tapering gracefully to a narrow base, and is ornamented over the greater part of the surface. It is believed to be 2000 years old.

The proprietors of the Savoy Hotel have recently purchased the property on either side of the present entrance in the Strand. As soon as building operations commence, it is intended to enlarge the accommodation of the hotel itself by an imposing erection, which, serving as an annexe to the original structure, will possess a frontage upon a spacious quadrangle, which will be introduced when the ground is cleared. The removal of the houses before the Cecil and the Savoy Hotels will give an imposing and widening aspect to the thoroughfare.

In St. Augustine's Church, Brooklyn, New York, the tabernacle of the high altar is protected by probably the most novel safe ever devised. This is undoubtedly the first time in which practical science has been used as an adjunct in religious service, says the Scientific American. Of course, it was very essential that the beautiful altar itself should not be marred in any way by the safe, and that it should be operated in a dignified and fitting manner. Unfortunately, in many churches, the richly jewelled receptacle for the sacrament has proved too often a bait for burglars, and many priests have tried to devise some scheme by which the security and sanctity of the tabernacle would be assured.

In the church referred to the receptacle for the sacrament cost 10,000dol. The safe weighs 1600lb., and consists of four pieces: the base, a curving piece of steel at the back that is stationary, and two circular curving doors which come together, closing the front towards the church. The leaves of these doors are made of Harveyised steel an inch thick. They meet as they close under the dome and overlap each other tightly. They turn on roller bearings, and they are operated by means of an electric motor. The safe is easily opened by manipulating buttons beside the tabernacle, but these push buttons will have no effect until the motor itself is set in motion in the vault below, the combination lock of the steel vault being known only to the priests of the parish. Electrical protection is also provided which would give notice at once to the nearest police-station should the safe be tampered with. Masked in its covering of gold leaf, this steel shell is a superb piece of mechanism.

THE Cork Echo is entirely dissatisfied with the character of the houses in the suburbs of the Irish city, and it trusts that when the electric tram opens up new building ground around Cork the builders will adopt some better plan for the erection of suburban villas, "as nothing could be poorer or meaner than the sort of dwelling-house now commonly raised in terraces round the city. Architecturally, these houses have no points of good style at all, not even simple prettiness, which is so easy to achieve. In and around Welsh and English cities, beautiful little houses are easily obtainable in terraces. Take, for instance, Cardiff. Some of the prettiest and most compact dwelling-houses one could wish to see are found in the suburbs of Cardiff. Though here in Cork we have not the advantages of Welsh brick and various sorts of fine native stone, still we should be able to improve upon our present system of running up houses which are nothing better than eyesores. The houses built in the neighbourhood of Cardiff are immeasurably superior to those around Cork, a fact worth noting at the present time."

AMONG the structural alterations which have recently taken place at St. Anne's Church, Edgehill, Liverpool, a most important need has been fulfilled in the matter of increased light in the sanctuary. By piercing the panelled vault overhead, sufficient illumination is now obtained to reveal much that was hitherto hidden of the beauty of Pugin's wonderful oak baldacchino. For the first time this exquisite piece of ecclesiastical wood carving may be seen in its entirety. The baldacchino—a canopy surrounding the altar—is a frequent feature in Italy, but perhaps in this country that at St. Anne's is the only example. It was designed by Welby Pugin, but it was at the instance of Peter Paul Pugin, his son, who found the design amongst his father's papers, that it was erected in its present position.

The structure is in the form of a groined canopy supported on four piers. The roof rises to a pinnacle 32ft. above the floor of the chancel. On the front piers are carved almost life-sized figures of St. Michael and St. Gabriel, and above them aspires an intricate mass of delicate carving, designed in Pugin's peculiar and beautiful adaptation of the Perpendicular Gothic. In spite of the enormous bulk of the upper portion, its minute tracery and elaborate piercing give it an ethereal lightness; and it is this, the most notable portion of the erection, that has erstwhile been lost in the gloom of a dimly-lit sanctuary. A fair conception of the amount of carving bestowed upon it by Messrs. Norbury and Paterson, of St. Luke's Studios, Myrtle Street, may be gathered from the fact that in all there are something like 5000 carved crockets and 300 to 400 columns in the structure. The Church of St. Anne is one of the best of Hanson's efforts. Planned like a cathedral, complete with north and south transepts, and a triforium over the choir, and kept within the severe limits of the Early English style, it is a church of somewhat distinctive character. But a wholly inadequate clerestory has made the nave too dark. The latter fault is now being remedied by an ingenious system of fenestration in the nave vault.

A PROPOSAL to reopen the old Norman west door of the church, which has been closed for upwards of fifty years, and to carry out certain other improvements connected therewith, is being considered at Halsewell. It has been discovered that the original ground level of the western door is something over 2ft. below the level of the present surface. The church used formerly to be entered through a very fine Norman doorway, and it was now proposed to reinstate that old doorway to its original proportions, and to make certain other alterations in the western part, which would show up the whole elevation as originally intended by the architect.

THE late Mr. Alfred Cock, Q.C., had a very wide reputation as a connoisseur of objects of Art, and his collection had long been the

admiration of his many friends. But the collection has been considerably over-rated, for there were very few objects of the first order of rarity or interest in the entire assemblage of over 500 lots which Messrs. Christie, Manson, and Woods have just concluded selling by auction. The total amount realised was slightly over £3000.

MRS. C. R. ROBERTS' art collection (late of Oakdale, Long Island, New York) included a suite of Louis XVI. carved and gilt furniture, the seats and backs covered with old Beauvais tapestry, and comprising a pair of sofas and six fauteuils, 3100 guineas; a Louis XVI. carved and gilt firescreen, with a panel of old Beauvais tapestry, 180 guineas. Various other properties included a sixfold screen of old Beauvais tapestry, each panel 60in. by 42in., 520 guineas; a pair of Louis XV. cassollettes and covers of gros-bleu Sevres porcelain, 18in. high, 440 guineas; two pairs of Louis XIV. upright black Boulle cabinets, formerly in the collection of the late Mr. Gladstone, £90 19s., and bought by Messrs. Radly, Robson, and Mackay, of Old Bond Street; a secretaire of the early Louis XV. period, 48in. high, 180 guineas; a Louis XV. marqueterie commode, 57in. wide, 220 guineas; a grand panel of old Brussels tapestry, representing the destruction of Niobe's children, 220 guineas; and a set of three panels of old Flemish tapestry, with Venus and other figures, 220 guineas.

For the purposes of the Building Act the district of Fulham (hitherto comprising the whole of the parish of Fulham), has been divided by the Council into two districts, viz., North Fulham, comprising that part of the parish lying to the north of the Fulham Road and High Street, Fulham, down to Putney Bridge; and South Fulham, comprising that part of the parish lying south of the above roads. At a recent meeting of the County Council, Mr. Stanley F. Monier-Williams, A.R.I.B.A., F.S.I., was appointed district surveyor for South Fulham, and Mr. Frederick W. Hamilton, A.R.I.B.A., district surveyor for North Fulham.

WITH the demolition of Mazas Prison, in Paris, the first prison in France constructed on the cellular system has disappeared. During the present century almost every French politician of note has been made familiar with its interior, for it was a great place for political offenders. It was named after General Mazas, who was killed at Austerlitz, and originally his name was over the principal entrance; but this was afterwards removed, as it was pointed out that it was a singular method of honouring a hero to call a prison after him. The boulevard itself in which it stands, and which is even better known as the terminus of the Lyons and Mediterranean Railway, was re-named a few years ago the Boulevard Diderot. The prison was of circular shape, and the cells, which radiated in long rows from the centre like the spokes of a wheel, numbered no fewer than twelve hundred. These cells were ingeniously constituted to enable each prisoner to see the chapel from his door, so that he could listen to divine service without going outside his place of solitary confinement.

MR. F. T. NORRIS writes from the Viking Club:—"Referring to the ancient camp at Uphall, between Barking and Ilford, of which several persons have written pleading for a Roman origin, I beg to point out that in an article written by myself, and communicated to the Gentleman's Magazine in October, 1888, I have advanced considerations for regarding it as a Danish fort. An important piece of evidence is that Barking was originally called Beddenham, and only after the (East) Monastery was burnt by Guthram and his Danes in 871 was it called Barking, a Danish place-name connoting ang or field of the borg or fort which they had built. Barking or Beddenham Monastery, of which one of the gates and possibly part of the church still remain, is remarkable for being the Monasterium on the east side of London which gave rise to the

title of West Monasterium for that of Westminster. The foundation of both (*circa* 670) is due to the same East Saxon Kings, as the unique extant charter, &c., show. I may add that both the Essex Naturalists' Field Club and the Essex Archaeological Society have collected bibliographies anent these earth-works."

THE destruction recently of another so-called "fireproof" business structure in New York City affords an additional illustration of the practical impossibility, under the present conditions, of checking a fire when it attacks the upper floors of a modern American "sky-scraper." Since business buildings in the United States have towered to a height of over six stories, the difficulty of providing adequate fire protection has become almost insuperable. Chief Bonner, of the New York City Fire Department, than whom there is probably no higher authority in these matters, does not scruple to declare that none of the modern "sky-scrappers" are fireproof, and that once a fire gets a good start in one of the upper stories nothing can be done but to let it burn. He holds, says *Cassier's Magazine*, that it is utterly impossible to fight a fire above a distance of 125ft. The only remedy that is suggested is the adoption of interior fire plants and the organisation of a fire corps of employes to operate them in case of an outbreak. A number of the high modern buildings in New York are already supplied with interior standpipes and the necessary equipments, but the majority of the owners of such structures are content to depend upon the so-called fireproof construction of the walls and floors, a protection which time and again has proved fallacious in actual experience. The insurance companies are actively working in this matter, however, and it is not unlikely that pressure will be placed on the building department of New York to compel owners of buildings over six stories high, in that city, to provide their own fire-fighting apparatus. It is not merely a question of danger to the building itself and its occupants, but also to the lower buildings adjoining, and to those across the street, when the street is narrow, as is so often the case in the crowded parts of a city. This was proved in the case of a recent fire, when two buildings on either side of a high structure were burnt out, and those opposite were damaged, and saved only with difficulty from sharing a similar fate.

FOR some time past a special committee of the Battersea Vestry has had under consideration the powers of that body with reference to the erection of municipal dwellings and other matters connected with the housing of the working classes. The committee have submitted a report to the vestry, in which they find that the vestry has no power to erect dwellings under the Housing of the Working Classes Act, 1890, except upon the clearance of small insanitary areas, the authority for the erection of working class dwellings otherwise than in the case of insanitary areas (under Part III. of the Act) being the London County Council. The committee are of opinion that the metropolitan vestries and district boards should have the power of erecting dwellings for the working classes, and they recommend that the London County Council be asked to insert a clause in their General Powers Bill empowering such authorities to erect such dwellings under Part III. of the Act, and that the several metropolitan vestries and district boards be asked to make a similar representation to the Council.

AT Dennington, in Suffolk, there is still preserved in the parish church an ancient sand-writing table. It consists of a flat top, surrounded by a wooden spline to keep the sand from falling off. Two wooden floats, having a strong resemblance to a plasterer's trowel, are used instead of indiarubber for obliterating the writing. This table was used at the beginning of this century for teaching children to write, the first finger or a piece of pointed wood being used to mark the sand. The sexton of the church was taught the art of writing in this very rudimentary manner. So ancient is this

method of writing that Euclid used it, working out his problems on the sand, and the Tamils of Ceylon used to let the nail of one finger grow until it assumed the shape of the quill, for the purpose of inscribing palm leaves. Thus, writing with the finger, which belonged to one of the oldest Buddhist sects, has continued almost until the present day.

THEY are very busy just now at the National Gallery. Rooms I., II., and III.—the large room facing you as you mount the stairs, with its annexes right and left—are in the hands of the decorators. The colour of the wall paper, if it has not yet been definitely chosen, should be carefully considered. Perhaps in the larger gallery we may yet see that pale bronze green adopted which is so cool and so grateful to the eye in the only room in which it has been tried, the gallery devoted to Raphael and the Umbrian masters.

THE scheme of the Glasgow Corporation for decorating the exterior of the new Art Galleries with sculpture is proceeding in the most satisfactory way, and tends greatly to the credit of the rulers of that energetic city. The last incident in the matter is that not only the sculptors, but the carvers who are to carry out the carved ornament, have been sent to Paris at the expense of the Corporation to examine all the old and modern work there. They were met there by the architect, Mr. Simpson, and Mr. Frampton, the sculptor appointed by the city, and spent some days visiting the most notable buildings. The competition has been enlarged, and instead of £1600, £2800 is to be spent on the eight figures of Science, Literature, Religion, Commerce, Music, Architecture, Painting, and Sculpture, which are to form prominent external features on the pavilion.

THE Royal Commission for the Paris Exhibition of 1900 has just issued a pamphlet giving the Committees and general classification of the Exhibition and the regulations for exhibitors, and also a map of the Exhibition grounds and buildings. From this it would appear that the large building where the pictures will be exhibited will be to the west side of the new Boulevard. It will reach from the Avenue des Champs Elysées, over the new bridge, to the centre of the Invalides. The Pavilion of the English Commission will be on the further side of the Seine, on the Quai d'Orsay, whilst the building in which the exhibits of the British Colonies and India are to be shown will be in the Trocadéro Gardens, near the site of the Japanese garden in the last Exhibition. The Committees, as at present constituted, seem to be singularly insufficient, presumably they will be considerably added to. Of the Committee which has to do with Works of Art, of the fourteen members a considerable number appear to be either mere figureheads or South Kensington officials, the only efficient members being the President of the Royal Academy, the President of the Institute of British Architects, the President of the Institute of Painters in Water Colours, Mr. Armstead, R.A. (presumably representing sculpture), Mr. J. S. Forbes, who is a connoisseur in foreign but not in English Art, and Sir William Agnew. It will certainly have to be considerably increased to be in any way representative or useful.

THE Committee of the House of Lords which has been sitting for some time past upon the projected Copyright Bill has, during the past few days, been enquiring into the artistic side of the Bill, and examining, among others, Mr. Briton Riviere, R.A., and Mr. Wells, R.A. From the length of time that has been spent over it, the Bill will probably suffer the fate of its predecessors, says the *St. James's Gazette*. It therefore seems a thousand pities that the various divisions of Copyright Law cannot be legislated one by one, for, to deal with artistic, literary, musical, and dramatic copyright in the same Bill is too much for any single session. Artistic copyright certainly deserves attention before anything else, for the blots upon the present law are many, and of much moment, whilst the remedy is

admitted on all sides, and might be dealt with very cursorily. At present the only question which appears to divide the Committee and the promoters of the Bill is that of who should have the copyright in a portrait. It appears to us that the contention of the artist that this should belong to him, even where the portrait is a commission, or to the photographer because he supplies the plate, is altogether untenable. The question of the duration of copyright is also one about which there should be no difficulty. At present it is altogether inequitable that the copyright in a work completed fifty years before the artist's death, and one which leaves his easel just before that event, should be of the same duration. On the other hand, to extend the copyright for thirty years after death, which might mean in certain cases 100 years, seems to us to be far too liberal a term in the interests of the public.

THE West Riding County Council has again had under consideration a proposed site for the new county lunatic asylum. As the cost of the buildings alone will probably be something like half a million, considerable importance attaches to the whole question. The Asylums Committee recommend the purchase of an estate at Kirkburton, near Huddersfield, which they consider to be the fittest available site for the purpose.

AFTER mature consideration the executive committee entrusted with the Robert Louis Stevenson memorial have now come to a definite decision regarding the form which it is to take. A fund of about £1400 has up to the present been raised, and it has been decided that the principal memorial is to be a mural monument, with a medallion portrait in high relief and architectural framework, to be placed in St. Giles's Cathedral, Edinburgh. The board of the cathedral are prepared to allot the Moray aisle as a poets' corner, and a very suitable site for the monument may be found in that part of the ancient building. The executive have secured for the execution of the memorial the services of Mr. St. Gaudens, the eminent American sculptor, who has produced pleasing sculptures of the great writer from life. If the amount of the subscriptions are sufficiently increased, the executive will also seek permission to place a handsome red granite seat upon Calton Hill, overlooking the Firth of Forth.

THE Bill to confirm a Provisional Order of the Local Government Board, relating to Leeds, Wakefield, and Manchester, last week came before a Select Committee of the House of Lords, presided over by the Earl of Ribblesdale.—Mr. Pember, Q.C., for the Corporation of Leeds, explained that one of the objects of their Order was to enable a clearance to be made of one of the lowest portions of Leeds, locally known as "The Shambles," the buildings on which consisted mostly of slaughter-houses. The intention was to make a new street from Briggate to Vicar Lane. To enable the Corporation to do this the Leeds Estates Company had offered to give them a large piece of land, to remove the existing buildings, and to bear the cost of the improvement, on condition that the Corporation undertook to construct the street as far as Briggate, and to maintain it. The only petitioners against the Bill were a body of charitable trustees in Leeds, who had some property in the immediate neighbourhood which they were willing to give to the Corporation, if the latter would alter the line of deviation so as to improve their frontages. This proposal and that of the Leeds Estates Company were considered by a committee of the Corporation, and the offer of the Leeds Estates Company was accepted as being the best. The recommendation of the committee was approved subsequently by the Corporation. Nobody would be injured by the proposed improvement, because nobody but the users of the slaughter-houses would be displaced, and they would be otherwise provided for. The new street would be an enormous relief to the traffic of Kirkgate.—After a short consultation the Committee passed the preamble.

The New Government Offices.

SELECTION OF TWO ARCHITECTS.

MR. AKERS-DOUGLAS has at length decided into whose hands to place the plans for the new public buildings which will presently, it is to be hoped, adorn Westminster. His method of selection disregards all the doleful precedents. He has had no competition such as gave us the Law Courts. He has preferred to judge upon past achievement rather than upon rival prospective plans. He invited the Royal Institute of British Architects to suggest some names to him, and to submit some drawings of their accomplished work. A dozen or so of architects sent in photographs and sketches on the suggestion of the Council of the Institute, and these having been examined in the Office of Works, the result has just been made known.

THE LARGER BUILDING

will face the widened Parliament Street, or King Street, on the East, and Great George Street on the South. It will house a whole family of departments. The Board of Trade is to have a home there, and the Local Government Board and the Education Department and some other Ministers are to be placed there. The task of providing them with walls and a roof has been entrusted to Mr. John Morton Brydon, F.R.I.B.A. He is a Scotsman, but for many years has worked in London. He will be remembered as the architect of the Women's Hospital in the Euston Road. He is responsible for some of the chief features of the Scottish Church in Chelsea. He built the town hall for Chelsea—not the frontage, but the hall itself, with its Adamesque suggestion. To him also, Chelsea is indebted for its free library. More lately he has been employed in the extension of the Municipal Buildings at Bath. He was a pioneer in his younger days of what was then called the Queen Anne school, which found London built of stucco, and left it a city of red bricks; though we believe he rather repudiates the old designation, exclaiming, "Queen Anne stood only for honest work." He is certain to produce something solid and substantial, without trickery of ornamentation, and probably with an old-world suggestion.

THE SECOND SITE

to be filled lies between Whitehall Buildings and Whitehall. It used to be known as the Carrington House site, and is almost immediately opposite the Horse Guards. Here the War Office has to be lodged. Its tabernacle is to be set up by Mr. William Young—an excellent choice. Mr. Young has done work of all kinds, both public and domestic; he, for instance, built Lord Wemyss his Scottish seat. But he is known all over the world as the author of the Municipal Buildings in Glasgow, whereof the people of the City of St. Mungo are so proud. The elevation of that fine building is striking and picturesque enough; but the interior planning is probably unsurpassed in any public building in Europe, not excepting the Palais de Justice at Brussels. Like Mr. Brydon, Mr. Young hails from the North of the Tweed, but settled early in London, and has lived and worked here ever since. It is not safe to speculate upon the style he will employ, as he is catholic in his tastes; but he is almost certain to adopt some form of the classic.

The architects for the Cardiff new municipal buildings recently waited upon the local authorities, and, replying to questions, said that they would be willing to submit the names of several firms who could act as quantity surveyors, and from such list the corporation could make a selection; they thought 1½ per cent. would be adequate remuneration for the quantity surveyors. The architects further said that it would be an easy matter to heighten the front of the building somewhat, and also to alter the dome, if desired. In their opinion, Portland stone would be the best for the external portions of the building. It was resolved that the quantity surveyors be paid 1½ per cent., and that the external portion of the building be of the best Portland stone.

HOW TO BUILD "FIREPROOF."*

By FRANCIS C. MOORE.

THE British Fire Prevention Committee has just issued its tenth publication—a paper on "How to Build 'Fireproof,'" by Francis C. Moore, President of the Continental Insurance Co., New York, delegate of New York Board of Fire-Underwriters to the Board of Examiners of the New York Building Department. The paper gives a summary of various suggestions as to methods of erecting "fireproof" buildings. This summary has been prepared in America, and the whole of the questions dealt with have particular reference to the constructional practice of the United States. This fact, however, in no way lessens the value of the paper for the Metropolis and the other great centres of the empire; for, with slight modifications, it applies equally to the buildings of all countries. The author opens with a number of propositions, which, although axiomatic in some instances, are based on sound principles, and are worthy of all acceptance. By arrangement with the Fire Prevention Committee, we are enabled to give these propositions:

"SLOW BURNING."

First. It may be claimed that no construction is "fireproof," and that even iron and masonry could with propriety be designated as "slow burning." The iron or steel used in a modern building has, in its time, been smelted in a furnace which presented no greater capacity for running metal into pigs than some of our modern buildings, whose interior openings from cellar to roof correspond to the chimney of a furnace, and the front door to its tuyere. If a pyrometer could be adjusted during the progress of a fire it would be found to rise quite as high as in any forge.

OPENINGS IN FAÇADES.

Second. Glass windows will not prevent the entrance of flame or heat from a fire in an exposed building. It may seem strange that so obvious a proposition should be thought worth stating, and yet to-day more than 75 per cent. of the "fireproof" structures of the country have window openings to the extent of from 30 per cent. to 70 per cent. of the superficial area of each enclosing wall without "fireproof" shutters. Heat from a building across a wide street finds ready entrance through windows, and the several "fireproof" floors serve only to hold ignitable merchandise in the most favourable form of distribution for ignition and combustion, like a great gridiron, to the full force of a neighbouring fire.

OPENINGS IN FLOORS.

Third. Openings through floors for stairways or elevators, gas, water, steam pipes, and electric wires, from floor to floor of "fireproof" buildings tend to the spread of flame like so many flues and should be fire-stopped at each story. This fault is more generally overlooked than any other. Ducts for piping, wiring, etc., should never be of wood. In the Mills Building, in New York, a fire, not long since, jumped through two or three floors from the one on which it originated, by means of the passageways for piping, electric wiring, etc., comparatively small ducts, but sufficient for the spread of flame. In one instance the fire skipped one floor, where it was cut off, and ignited the second floor above.

"FIREPROOFING" IRON MEMBERS.

Fourth. In view of the fact that it is necessary to cover iron with non-combustible, non-conducting material to prevent its exposure to fire and consequent expansion, and in view of the fact that all ironwork, except cast-iron, will rust to the point of danger, it is best to use cast-iron for all vertical supports, columns, pillars, &c. It is not advisable, of course, to have floor beams of cast-iron (except in the form of Hodgkinson beams thoroughly tested). If a floor beam should give way, however, it might not necessarily wreck the building, whereas if a vital column should give way a

collapse of the entire structure might result. . . . In my opinion, cast-iron columns are superior to steel and more reliable. It is not generally known that American cast-iron is vastly superior to English cast-iron, and will stand a greater strain without breaking. Cast-iron, moreover, will not expand under heat to the same extent as wrought-iron and steel, which is another fact in its favour.

COLUMNS SHOULD BE STRIPPED.

No bearing column should be placed in such a position that it cannot be uncovered and exposed for examination without danger to the structure. One of the ablest architects in New York makes it a rule to so "fireproof" his columns that they can be examined at any time by removing the "fireproofing" to determine whether rust has invaded their capacity to carry their loads. In my judgment, periodical examinations should be made, from time to time, in this way, of all wrought-iron or steel columns, as it may happen that a leaky steam or water pipe has worked serious harm. Such a discovery was accidentally made recently in an important New York building. . . .

EXPANSION OF IRON.

It is generally supposed, and frequently stated, that there is a great difference between the expansion of iron and masonry by heat. This is not the case. For example, the length of a bar which at 32 degs. is represented by 1, at 212 degs. would be represented as follows:—

Cast-Iron	1'0011
Wrought-Iron	1'0012
Cement	1'0014
Granite	1'0007
Marble	1'0011
Sandstone	1'0017
Brick	1'0005½
Fire-brick	1'0005

In the "fireproof" building of the Western Union Telegraph Company, in New York, some years ago, a heavy brick pier, 7ft. or 8ft. in diameter, adjoined the wall of the boiler furnaces. The difference in expansion in the brickwork next to this furnace wall as compared with that of the remaining brickwork of the pier was so great as to produce a crushing of the material from top to bottom of the pier for a depth of several inches, and it was found necessary to change the furnace wall and leave an air space between it and the pier.

RELATIVE EXPANSION OF IRON AND MASONRY.

While the difference in expansion between masonry and iron incorporated with it is less per running foot than is generally supposed, and while the difference in expansion between a cubic foot of iron and that of a cubic foot of masonry would hardly be noticeable, especially if the iron were covered on all four sides, yet in stretches of 50ft. or more, as in the case of iron I-beams and girders, the cumulative effect of expansion in uncovered iron might be a serious matter—quite sufficient with the rises of temperature due to a burning building to push out the bearing walls and wreck the building. Especially is this true of temperatures higher than 500 degs. It is unnecessary to suggest that metal differs from masonry in the important respect that heat does not travel throughout the entire length of the latter, while it does in the case of metal. In other words, while the difference between the expansion of a lineal foot of iron as compared with a lineal foot of masonry, marble, brick, &c., is very slight, the difference in conductivity is very great. The conducting power of silver, for example, being represented by 1, copper would be .845, cast-iron .359, gold .981, marble .024, and brick .01—an important fact to be considered in the construction of buildings. Brickwork raised to a white heat would not raise the temperature of other masonry in the same wall a few feet away; but one end of an iron I-beam could not be raised to a white heat without raising the temperature of the beam for its entire length. It is a well-known fact that iron responds so readily to temperature that, in surveying land, a surveyor's 100ft. iron chain will, in measuring the distance of a mile, result in a variation of 5ft. between winter

* "How to Build 'Fireproof.'" By Francis C. Moore. The British Fire Prevention Committee, 1, Waterloo Place, London. 1s.]

temperature and summer temperature, resulting in an error of one acre in every 533.

PREVENTIONS AGAINST EXPANSION.

Where iron beams and girders are inserted in walls without sufficient space left for their expansion under heat, they are almost certain to overthrow the bearing walls by their expansion thrust. A large warehouse in Vienna, in which such provision had been contemplated by the architect, was totally destroyed, with its contents, by reason of the fact that an officious subordinate, discovering the space in the wall purposely left at the end of each beam, deliberately poured liquid cement therein, which, having set, effectually thwarted the well-meant intention of the architect, and resulted in the destruction of the building.

EXPANSION THRUST.

The expansion thrust of iron beams may be computed upon the following factor of expansion: Rolled iron of a length of 1562ft. will expand one-eighth of an inch for every degree of temperature. The heat of a burning building, as already stated, is enormous—sufficient to fuse most known materials. It may safely be estimated to be at least 1000 degs.; therefore, a length of rolled iron of 1562ft., at 1000 degs. of temperature, would expand about 125in., and a 50ft. length of iron girder would expand between 4in. and 5in., showing that there should be a play at each end of at least 2in. if the iron is not fireproofed. Inasmuch as in iron construction the iron beams and girders are usually anchored to the walls to steady them, space should be left, and the tie to the anchor should be by a movable hinge joint, which would be of the same strength, with an inflexible anchor for all tying purposes; but would yield under the thrust pressure like an elbow, and allow play of the beam; or stiff anchors should have elongated holes to allow expansion when beams are of great length. Girders are seldom over 25ft. long, but if bolted together, as is frequently the case, they may be 120ft. or more long, and a line of columns from cellar to roof of a building may easily have one continuous iron structure of two hundred or more feet. It should be remembered, however, that this danger from the expansion of iron may be almost wholly counteracted by protecting it from exposure to fire through the use of non-conducting material. It is more important to protect girders than beams.

ROOF.

Fifth. The roof, that portion of a building which ought to be most carefully watched during construction, is often the most neglected, woodwork entering into the composition, as in the case of the Horne Building at Pittsburg, where the cornice was supported on wooden outriggers.

PARTITIONS.

Sixth. Partitions. These should not be erected upon wooden sills, as is sometimes the case—only, however, with ignorant and inexperienced architects, who suppose that it is necessary to use wood in order to nail baseboards and other trim at the bottom of the partition. Porous terra-cotta will hold nails, and should be used in preference to wood, which, as soon as it burns out, will let down the entire partition.

[The seventh proposition deals with the provision of water standpipes, and the eighth with the necessity of a night watchman.]

STONE STAIRCASE TREADS.

Ninth. Marble, slate, and other stones are certain to disintegrate or crumble when subjected to the joint action of heat and water. For this reason 90 per cent. of the staircases in modern "fireproof" buildings would be found utterly unreliable in the event of fire, either for the escape of the inmates or the use of firemen—a serious consideration. Stone treads are usually let into iron rabbet frames, and as these stone treads would give way in case of fire, it would be impossible for a person to find a footing on the stairways; 2in. oak treads might actually last longer; but a safer staircase would be one the framework of which is of iron, the tread having an iron web or gridiron pattern, the interstices or openings of which should be small enough to prevent

the passage of a foot, underlying the stone or slate, so that if the stone tread should disintegrate, the staircase would still remain passable. It is possible to have the supporting tread of open-work cast-iron in an ornamental pattern, which, in relief against the white marble tread resting on it, would present a tasteful appearance from the underside or soffit of the staircase, with this great advantage, that, in the event the action of fire and water should pulverise the marble or slate tread, it would still afford a safe support for the foot. In the case of the burning of the two "fireproof" buildings, Temple Court and the Manhattan Savings Bank, in New York, the slate treads yielded early in the fire, leaving staircases with openings the full size of the tread, which, within a few minutes after the fire started, were impassable for either firemen or inmates. It is astounding that this vital fault should be so generally overlooked in "fireproof" buildings.

HEIGHT OF BUILDINGS.

Tenth. No building should exceed in height the width of the street on which it is located, from the view of light and health; nor, in any case, in excess of 95ft. for mercantile occupancy, nor a height in excess of 200ft. for office occupancy.

DESTRUCTIBILITY OF CONTENTS.

[The eleventh proposition shows how "combustible material will sometimes be more effectually and thoroughly destroyed in a 'fireproof' building than in an ordinary building, since the early collapse of the latter may smother the fire and effect salvage, whereas 'fireproof' floors will support the contents of the former, and distribute them so that they are more certain to be destroyed."]

ENCLOSING WALLS.

Twelfth. These should be of brick, the brickwork of the lower stories especially, if not of all, being laid in cement mortar. In fact, the specifications for a building in the compact part of the mercantile section of a city ought to be drawn in contemplation of the possible cremation of its contents, and the generation of heat considerably greater than 2000 degs. Fahr. The heat of a wood fire is from 800 to 1140 degs.; charcoal, about 2200 degs.; coal, about 2400 deg. Cast-iron will melt at between 1900 and 2800 degs.; wrought-iron, 3000 to 3500 degs.; steel, 2400 to 2600 degs.; and if an architect should be required to draw specifications for a building adjoining others, with the knowledge beforehand that its entire contents, from cellar to roof, were to be totally consumed, and he were under a bond to pay damages to surrounding property, he would not be more severe in his exactions than should a building law protecting neighbourhood rights in the enjoyment of property; for a mercantile or manufacturing building sometimes generates a greater heat in combustion than a smelting furnace.

In the course of excavations now being carried on in the Via Venti Settembre, at Genoa, a tomb of great antiquity has been found. In form the tomb resembles those of Corneto—the so-called well tombs—but its contents make it appear of rather more recent date. The cavity is about 80 centimetres in diameter by 60 centimetres deep. It is closed by a huge slab of cut stone, some 20 centimetres thick. Inside a large vase of the form known as crater vases was found, though unfortunately broken into several pieces. It seems to have served as a funeral urn, and was about 60 centimetres in height, and magnificently decorated. Numbers of pearls of great value are set on the edge of the vase, and around the sides are drawn in red on black many figures of priests and warriors. The date assigned to the vase is the third century B.C. In the same tomb a bronze water vase was found, extremely elegant in shape, and apparently of Greek origin. It is thought probable that before the excavations are finished other tombs of a similar nature will be discovered, as some years back a group of tombs of the Roman epoch was brought to light at Genoa, not far from the spot where the present discovery has been made.

MAKING A TUNNEL.

CONCERNING THE NEW SUBTERRANEAN RAILWAY.

DEEP down in the London clay, during the greater portion of the last two years, hundreds of brawny giants have been busy hollowing out, between the Bank and Shepherd's Bush, two great twin tunnels. Now the work is nearing completion. Connections have been made in nearly all cases. Temporary lines of railway have been laid down, and beneath the feet of the heedless, hurrying crowds that throng Oxford Street, and Holborn, and Newgate Street, perky, puffy little engines are engaged at this present moment in hauling trains of huge iron skips, each filled to overflowing with the blue-black, unctuous sub-soil. It has been a "dhivil of a job," says the Daily Mail, in quoting the words of an Hibernian foreman of works. The hardest kind of labour, pursued under apparently the hardest kind of conditions! Yet the men do not seem to mind, but

HEW AND DELVE AND PICK

away as merrily as though they had the blue sky above them, instead of thousands of cubic yards of earth and clay, that one would imagine might at any moment crash in upon them and overwhelm them. But the engineers laugh when you suggest any such eventuality, and when you come to examine the works more closely you see why. The fact of the matter is that the Central London Railway tunnels are not tunnels at all in the ordinary acceptance of the term. They are gigantic steel pipes, each 11ft. 6in. in diameter, that have been carried down the shafts in sections and fitted and bolted together underground. There is thus no more danger of a "cave in" than there would be in the case of a main outfall sewer. Nothing more strikingly illustrates the immense strides that within the past couple of decades have been made in engineering science than the driving of this same underground railway, the biggest and most important work of its kind, be it remembered, ever undertaken in England. Under

THE OLD CUT-AND-COVER METHOD

of tunnel construction it would have been impossible. Many people will doubtless recall the frightful dislocation of traffic, to say nothing concerning the loss to the shopkeepers along the line of route, caused by the building of the extension of the underground railway beneath the Mile End Road in 1884. In this case the now obsolete cut-and-cover principle was adopted. The whole of the roadway was converted into a gigantic trench, and for a considerable length of time traffic was entirely suspended. Fancy, Cheapside, Newgate Street, Holborn, Oxford Street, and the Bayswater Road being so served for a period of more than twenty-four months! Instead, the only notification afforded to the inhabitants of the Metropolis of anything unusual going on has been the presence along the line of route followed by the new railway of certain monster hoardings, behind which may be caught occasional glimpses of donkey engines, cranes, horses and carts, and huge stacks of tunnel sections. Each of these labour colonies marks the mouth of a shaft, and will eventually be

THE SITE OF A REGULAR STATION.

The shafts vary in depth. The one opposite the Bank of England, for instance, terminates at 60ft. below the level of the street; that at Oxford Circus has been carried down another 20ft.; while at Notting Hill a depth of 92ft. from the surface has been reached. The modus operandi is, however, in all cases the same. First there is dug out, by manual labour, a big round hole, the exact size of the proposed shaft. This is sunk further and further down into the bowels of the earth with each succeeding day; care being taken to line the hole thus excavated with steel sections, of a similar nature to those afterwards used in constructing the tunnel itself. Then, when the required depth has been reached, the vertical excavation is converted into a horizontal one, running east and west at right angles to the shaft. At first the clay is

removed by spade and mattock and pick. But as soon as a few cubic yards have been dug out and hauled to the surface, a strange-looking cylinder of steel is lowered down and fixed in position. This is the Greathead Shield, without whose aid such work as this would be, to all intents and purposes, impossible of accomplishment. In rear of this remarkable labour-saving engine are placed a number of hydraulic jacks, and slowly, but with irresistible force, it is "persuaded" to move forward. In the meantime, the men have still been busily delving ahead into what is now the tunnel, but instead of excavating its full diameter, they merely remove a sort of central core, as it were, of from 4ft. to 5ft. in thickness. Then along comes

THE CIRCULAR STEEL SHIELD,

with its knife-like edge, scooping out the remainder of the clay, and causing it to fall inwards in massive flakes. These are promptly broken up, shovelled into the skips, and dragged off to the mouth of the shaft, whence they are hauled to the surface and carted away. The shield, it should be noted, is just a trifle larger than the finished tunnel, thus enabling the steel sections to be built up and bolted together before it is again moved forward. By this means all risk of a "cave-in" is absolutely obviated. Afterwards, as soon as the shield is again pressed forward, the space formerly occupied by it, between the outer side of the tunnel and the clay, is filled with "grouting." Grouting is a mixture of cement and lime, which dries very speedily, and is, when dry, exceedingly hard. It is forced, by means of compressed air, through holes purposely left in the sheathing, and, as soon as it sets, that particular segment is considered to be completed. The "jacket" of grouting serves, in fact, the double purpose of guarding against any risk of subsidence, such as might conceivably affect the stability of the buildings above, and entail endless litigation and possible heavy damages, and of "clothing" the pipe-tunnel in

AN IMPERVIOUS TUBE OF CEMENT,

thus keeping it from contact with the water that is constantly filtering down from above. The bulk of the actual work of excavation has now been done, and, unless some unforeseen difficulties intervene, it is unlikely that the opening of the new line will be deferred beyond next January at the latest. There will be thirteen stations in all, and the entire journey is $6\frac{1}{2}$ miles. The new line is carried in two iron-bound tunnels which have, as far as possible, been excavated under the public thoroughfares; and at one point only—near Stamford Street, Blackfriars—has it been necessary to make any arrangement with the owners of private property. Hence the railway has been constructed at very small cost as compared with the estimated expenditure involved by other schemes which have from time to time been submitted to the consideration of the London and South-Western Company. An independent company was created to carry out the project, capital being raised in the first instance to the amount of £540,000. Under the Act of Parliament which authorized the

CONSTRUCTION OF THE LINE,

power was obtained to provide two stations only—one at Waterloo and the other at Bucklersbury, quite close to the Mansion House. The platform of the Waterloo terminus, laid at a depth of 41ft. immediately underneath the principal main lines of the London and South-Western Railway, is approached by a series of inclined ways which can be entered from various points of that company's station. After a somewhat sharp curve into York Road, the underground tunnels, rapidly descending, cross Waterloo Bridge Road, and follow the route of Stamford Street as far as Hatfield Street, where they turn in a north-easterly direction. Penetrating the bed of the Thames on a slight incline—arranged for the purposes of effective drainage—they emerge on the Middlesex side of the river, in front of the Royal Hotel, and passing the foundations of the Times office, proceed under the centre of Queen Victoria Street to the City Terminal Station,

which will eventually have an entrance to the public subway now in course of construction under the busy crossing in front of the Mansion House, the Royal Exchange, and the Bank of England. Passengers by the Central London Railway will use the same subway, but in the first instance the approach to the City station of the Waterloo and City Railway will be by means of two staircases rising to the street level near the premises of the National Safe Deposit Company in Queen Victoria Street. Although no provision of the kind has been made in the contract, it may eventually be found necessary to construct lifts at the City terminus, if not also at Waterloo. The railway works have been carried out by Messrs. Mowlem and Co., the engineers at the outset being Mr. W. R. Galbraith, M.I.C.E., and Mr. J. H. Greathead, M.I.C.E., and Mr. Harley H. Dalrymple-Hay, A.M.I.C.E., acting as resident engineer. Mr. Greathead died before the completion of the contract, and his place has since been taken by Professor A. H. W. Kennedy. Much of the tunnelling was executed

IN COMPRESSED AIR LOCKS,

owing to the fact that the deep excavation had to be continued through a strata of water-bearing gravel. This process was especially necessary at Blackfriars, where the line passes below the main sewer of the London County Council, carried under the Victoria Embankment. The tunnels were set with remarkable accuracy, and where compressed air had not to be employed the ordinary rate of progress was about 10ft. per day of completed work. At Waterloo a peculiar difficulty presented itself. There was not room enough to make a cross-over road without occupying considerable space underneath the station of the South-Western Company, and in order that this area might be utilised to the best advantage it was necessary to remove one of the massive brick piers on which the superstructure rests. The task was successfully accomplished by the construction of a single span arch of 40ft., and there is now ample room at each terminus for the rapid and regular working of a five-minute service of trains.

A new building has been opened at the rear of Garfield House, 8, Fitzroy Square, in connection with the home for working girls. Hitherto there had been accommodation for fifty girls, and the new extension will permit an additional forty-seven to make their abode at the home. The additional accommodation has involved an unlooked-for extension of the lavatory, baths, and sanitary arrangements, as well as the provision of an enlarged dining-hall.

The fifty-fifth annual congress of the British Archaeological Association is now being held at Peterborough. Peterborough and its immediate neighbourhood is particularly rich in archaeology, and excursions have been arranged to Caistor for its famous Norman church, Barnack for its fine Saxon church, Stamford and Burghley House, the historic seat of the Marquis of Exeter; Spalding, Little Gidding, and Yoxley churches; Northborough, the home of the Claypole family, and intimately associated with Cromwell; Fotheringay Castle (the scene of Mary Queen of Scots' tragic death); Apeltorpe Hall (the seat of the Earl of Westmorland), &c. Lord Melville will read a paper on Latham Hospital, at Oundle; Dr. W. de Gray Birch on the history of Ramsey Abbey (now the seat of Lord de Ramsey); Dr. Walker, of Peterborough, will describe the Saxon and Roman occupations of Peterborough; Miss Edith Bradley is to dilate upon Crowland, and the legend of St. Guthlac; whilst other matters connected with the fens and local history are to be discussed. The members of the Congress assembled at the Cathedral in the afternoon of the first day, and Dr. Ingram delivered an address on its history, with particular reference to the restoration of the west front, now in progress, and the recent discoveries of the remains of a Saxon church under a portion of the eastern chapel, now under repair. The Bishop of Peterborough afterwards delivered his inaugural address, and the Rev. Canon Sigers read a paper on Barnack Church.

L.C.C.

THE NEW STREET SCHEME.

THE proposal of the Improvements Committee of the London Council for the formation of a new thoroughfare between Holborn and the Strand—an account of which has already been published in these columns was discussed at some length at a recent meeting of the Council.—Mr. Campbell introduced the subject by moving to refer back the paragraph in the Finance Committee's report which set forth the cost of the improvement, £774,200. He said he was appalled at the magnitude of the scheme. It was proposed

TO BUY UP THREE THEATRES

and no end of other buildings, and it would lead to an annual charge in the first instance of £70,000 or £80,000. He wished to have the report referred back, in order that the Finance Committee might devise some means for paying interest out of capital whilst the improvement was being carried out.—Colonel Ford seconded.—Lord Welby said the committee had carefully considered their proposals, and it would be a mistake to refer the report back.—Upon a show of hands the amendment was rejected by a large majority, and the report received.—After further discussion the report was adopted.—Mr. Shaw-Lefevre then moved the reception of the main report of the Improvements Committee dealing with no fewer than six schemes; the street from Holborn to the Strand, Cat and Mutton Bridge, Old Gravel Lane Bridge, High Street, Kensington, Wandsworth Road, and Southampton Row. He pointed out that all these improvements involved an expenditure of £1,100,000. The main improvement, however, was the

HOLBORN TO STRAND THOROUGHFARE,

which involved an expenditure of £774,000. The scheme had been universally welcomed by the public. It was essentially necessary that the Council should understand that any delay in carrying out the improvement would involve the Council in a vastly increased expenditure. It was essentially the same scheme as that formulated by Mr. Frederick Harrison some years ago, with the exception that the Strand end of the street terminated in a crescent. By this plan the traffic going east and west would be better divided than if a direct route to Holborn were made. This was the first time it had been undertaken to re-house all the people who would be displaced by the scheme, and it would cost the Council a considerable extra sum of money. From whatever point of view the scheme was regarded as a street improvement, as a great sanitary improvement, involving the improvement of the whole district, or as an architectural improvement, it would add to the

DIGNITY AND BEAUTY OF LONDON.

—The report was received.—Upon the first recommendation, as follows, "That the Council do apply to Parliament in the Session of 1899 for powers to construct a new street, and branch streets, 100ft. wide, from Holborn to the Strand, and to carry out the subsidiary street improvements in general accordance with the scheme shown on the plan approved by the Improvements Committee on May 25th, 1898," Dr. Cooper moved, and Mr. Glanville seconded, an amendment that the Council should take no steps until after the Royal Commission on Local Taxation had issued its report.—Mr. Beachcroft having spoken in favour of the recommendation, Mr. Cornwall thought that any further delay would only put more money into the pockets of the ground landlords.—Mr. Henry Clarke advocated the adoption of the scheme, which, if carried out, would give London one of the handsomest streets in Europe.—Upon a division, after further discussion, the amendment was rejected by 93 to 20 votes.—Another amendment, moved by Colonel Ford, was lost by a large majority, as was one moved by Mr. Bond, M.P., in favour of moving the Church of St. Mary-le-Strand, and the Committee's recommendation was then agreed to with one dissentient.—The following recommendations

were adopted without discussion: That the question of powers being sought to enable the Council to lay tramways along the new streets be referred to the Highways Committee for consideration and report. That provision be made for the construction of a subway under the new streets (for mains, wires, &c.), and also for the planting of trees in the new thoroughfares. That provision be made in the Bill for part of the cost of the improvement to be dealt with on the same general principle as that embodied in the improvement charge sections of the London County Council (Tower Bridge Southern Approach) Act, 1895, but that a longer period than three years be allowed within which to judge of the effect of the improvement upon the surrounding property. That provision be made by scheme for re-housing within about a mile of their residences all the persons of the labouring class displaced who are dependent on fixed employment in the neighbourhood, and that adequate provision be made elsewhere for the remainder of the persons displaced.—This exhausted the recommendations of the Committee, whose scheme has thus been adopted in its entirety.

R.I.B.A.

THE JUNE EXAMINATIONS: LIST OF SUCCESSES.

THE following have passed the June Examinations of the Royal Institute of British Architects:—

PRELIMINARY.

P. P. Abercrombie, C. J. H. Ascroft, S. B. Ashworth, H. W. Asman, A. H. Atkinson, F. Barclay, H. M. Barker, M. S. Bigwood, H. T. Bill, R. H. Boyd, A. C. Broadbent, W. Broadbent, C. A. Broadhead, J. T. W. Brooke, A. E. Brooker, E. D. Brown, J. Brown, E. A. Brymer, A. A. Carder, W. A. T. Carter, R. M. Chalmers, A. L. Chapman, S. W. Clark, H. H. Clegg, A. R. Conder, V. C. Cook, E. C. R. Dibdin, H. H. Dodd, L. W. Ensor, J. W. H. Farrow, A. E. C. Fenoulhet, J. R. Fothergill, R. R. Gall, H. W. Gammidge, A. E. Gelder, C. R. B. Godman, V. R. Gould, W. L. Guest, E. Harding, J. A. Harrison, O. B. Hatchard, T. Hedges, A. Herklotz, W. H. Hobday, A. H. Johnson, L. A. Jones, S. A. Kelly, H. Kenchington, W. Leaning, A. H. Lewis, J. Love, G. H. Lovegrove, B. J. McAdam, A. McDonald, J. C. Mackenzie, H. N. Maunder, W. Michelmores, J. Miller, P. Minor, A. C. Notley, E. Ogden, C. T. Palmer, E. O. Payne, W. S. Payne, T. S. Peace, A. M. Peart, R. T. W. Purchas, A. R. F. Raven, G. Raymond, A. J. Redfern, W. B. Rees, W. F. Richardson, A. R. Robertson, J. G. Robertson, G. M. Roe, S. Salisbury, E. M. Simpson, G. S. Simpson, M. Skinner, E. R. Sladen, P. J. Smith, M. S. Stillman, F. G. Stockdale, F. A. Stowell, H. M. Tait, E. R. Taylor, A. Tedman, R. W. Thomas, F. E. Tomson, H. Wakeford, C. F. Wood, W. Ward, A. E. Webb, R. D. Wells, P. J. Westwood, J. Wilson, D. Wood, C. L. Wright.

INTERMEDIATE.

R. P. Twizell, T. J. Bee, S. Harrison, R. T. Barker, J. G. Ross, C. H. F. Comyn, J. E. Fawcett, A. E. Lacey, L. F. Ward, J. Quail, J. H. Gibbons, N. Thomas, C. H. Heathcote, S. G. Highmoor, H. Moger, H. Gelder, A. Woodroffe, J. F. J. Goodacre, P. J. Turner, R. D. Wells, G. A. Brown, J. M. Ross, A. S. Dorrell, J. I. P. Jones, H. S. Barrett, C. A. Strachan, R. B. Brook-Greaves, H. I. Triggs, E. G. Heathcote, P. T. Hopwood, F. R. Foster, W. Higenbotham, N. Thorp, J. T. Alexander, H. C. Bishop, F. W. A. Buckell, F. B. Chester, W. W. Ellison, P. E. Gloyn, K. J. S. Harris, J. H. Higson, J. Holt, G. F. M. Merriman, J. L. Nicholson, H. W. H. Palmer, A. R. P. Piercy, F. E. Price, E. E. Shepherd, E. A. Toombs, W. J. Walford, H. P. Williamson, W. Wrigley, C. F. Young.

FINAL.

J. C. Bains, P. C. Blow, V. E. Böhser, R. W. Carden, E. M. Charles, A. Cowie, S. C. Denmead, A. R. Gough, J. S. Harrison, A. Herbert, G. McMichael, L. Moore, C. Riddey, C. W. Surrey, A. W. Vercoe.

Professional Items.

ABERDEEN.—The extensions to the bathing station at Aberdeen, comprising a large swimming bath and a new block containing Russian, sitz, and several additional private baths, are now nearing completion. Like the original building, the new block is built of brick. It adjoins the south end of the main building, and is of two stories, with ornamental turrets at the four corners.

ASCOT.—The Royal Victoria Cottage Nursing Home has just been opened at Ascot. The building has been erected at a cost of £3400. The hospital is intended as a nurses' home as well as affording accommodation for patients. The architect is Mr. W. Menzies.

BIRMINGHAM.—The new Sunday Schools of Carver Street Wesleyan Chapel were opened last week. There is a large lecture hall. Twenty-four extra class-rooms have been provided, and there is a good kitchen and the usual outbuildings. The cost has been between £4000 and £5000. The new building has been designed by Mr. H. W. Lockwood, of Palatine Chambers, and Messrs. Malthouse and Ward are the contractors.

BRISTOL.—The site at the back of the Bristol Council House is being cleared for the erection of the temporary Council Chamber, the cost of which is to be limited to £2500. The City Engineer (Mr. T. H. Yabbicom) has endeavoured to provide a spacious, well-arranged, and convenient meeting-room. The entrance to the annexe will be at the half-level of the present staircase, the windows in which will have to be partially cut away to make room for the folding doors, which give access to a vestibule, behind this being a cloak-room. The Council Chamber will be 57ft. long by 34ft. wide and 21ft. in height.

CARDIFF.—The foundation and memorial stones of a new church have just been laid in Neville Street, Riverside, Cardiff. The building will be in the Perpendicular style of Architecture, with an imposing front, a fine central window being flanked by two ornate turrets, terminating in spires. Maescymmer thin coarse stones will be used, with Bath stone dressings. The architects are Messrs. Veall and Sant, and the contractor Mr. W. T. Morgan, Lochaber Street. The building now being proceeded with will give accommodation to 600 people, and will cost £3000. Space has been reserved for a schoolroom, and at a later date it is proposed to add a gallery to the chapel, bringing the total cost to over £4000.

DEVONPORT.—A new chapel is in course of erection at Ford, Devonport. The building is designed in Late Perpendicular style. It will be built of red brick, relieved by polyphant and Douling stone dressings. The main front will have a gable, with a handsome five light tracery window, and will be flanked on both sides with turrets. There will be two main large entrance doorways opening into a lobby, and one doorway to each turret, which will form the future gallery entrances. Two vestries are provided, together with an organ chamber and choir seats. Heating is to be supplied by means of hot-water pipes. The roof is to be open timbered, and the pews will have modern pitch-pine bench ends. Messrs. Wiblin and de Boynville, of Plymouth, are the architects, and the contractor is Mr. W. Partridge, of Mutley.

DONCASTER.—St. Mary's Church, Doncaster, which was built in 1885 from designs prepared by Lord Grimthorpe, has just been renovated and certain alterations effected. The structural alterations have been made by Mr. W. Anerley, builder, the painting, &c., done by Mr. W. N. Gyles, Copley Road, and the altar cloth, curtains, &c., were supplied by Messrs. Jones and Willis, Birmingham. The organ has been cleaned and re-toned by Mr. E. J. Pillin.

DUNDEE.—The Free Church at Bow of Fife has recently undergone reconstruction.

Erected from plans prepared by Mr. James Gillespie, St. Andrews, the building is in type characteristically Scotch. On the north-east flank there rises a substantial square tower to a height of 60ft., surmounted by a red tiled spire. The contractors were:—Mason, A. Black, Cupar; joiner, A. Smith, Cupar; slater, J. Fyffe, Cupar; plumber, W. Brown, Cupar; plasterer, A. McRitchie, Dundee; painter, J. Randall, Cupar.

GOVAN, N.B.—The hospital recently erected in connection with the Hawkhead Asylum of the Govan District Lunacy Board has been formally opened. The site of the hospital is to the east of the asylum, and it includes sections for the treatment of recent and acute cases, infectious cases, and sick and infirm cases. There are separate rooms for each patient, and accommodation is provided for 144 altogether. With the erection of the hospital the asylum buildings are now complete, the work of construction having been going on since 1891.

LIVERPOOL.—It has been decided to proceed shortly with the erection, in Kingsley Road, of the long-projected new church under the dedication of Our Lady of Lourdes and St. Bernard, to the designs of Messrs. Pugin and Pugin, of London. The estimated cost is about £8000. The new church, Gothic in style, will consist of a fine nave and a parallel chapel equal in length; the latter dedicated to Our Lady of Lourdes, with her altar and a grotto, the former to her apostle of predilection, the Monk of Clairvaux.

The Cook Street Arcade, which has been so long in course of construction, is steadily progressing towards completion, and the question of how the various archways are to be illuminated has been brought to the notice of the Corporation Lighting Committee. A report with reference thereto is to be prepared by Mr. Bellamy, superintendent of street lighting.

LONDON, E.—The new premises of the Church Training College for Lay Workers, situated at 384–392, Commercial Road, E., and erected at a total cost of £15,000, were formally opened last week. The buildings, which have been designed by Mr. Keith D. Young, are of a commodious character, and room has been provided for 40 resident students.

MALTON (Yorks.).—The old parish church of St. Nicholas, Norton, Malton, which has been replaced by the handsome but unfinished church of St. Peter, is at last to be pulled down. The building, which is so plain as to be bordering on ugliness, is not an ancient one, only dating from the close of the last century. The place is now getting into a dilapidated state, and it is absolutely necessary that something should be done, as there are some objects worth preserving. There is a fine east window of stained glass, with the emblems of the four Evangelists, and this it is hoped to transfer to the west end of the new church. There are also some important mural monuments, including one to the late John Scott, of Whitewall House, which is in the parish of Norton.

PEEBLES.—A drinking fountain has been erected in Peebles in memory of the late Professor Veitch. Erected to designs by Messrs. Sydney Mitchell and Wilson, Edinburgh, the fountain consists of a square base set diagonally with the angles rounded off. The sides are paneled, the panels being filled in with polished grey Aberdeen granite. From the base rises a richly-moulded and decorated Renaissance column, on the square die of the base of which there is a sunk panel filled in with an alto-relievo bust of the professor in bronze executed by Mr. Webster, sculptor Edinburgh. Above the square die is a circular moulded base, and the column proper rises above this from a cluster of acanthus leaves finely carved out of the solid granite, topped with a carved capital on which rests a lion in bronze supporting a shield bearing the Peebles arms. The shaft of the column is richly

decorated with festoons and drops of cherub heads and lyres in bronze. The whole fountain, with the exception of the bronze work and the Aberdeen grey granite panels of the base, is executed in fine axed Corrennie granite. There are two drinking basins with finely modelled bronze cups, and a dog trough is also provided. The fountain, which stands 14ft. 6in. high, has been built by Bailie Ramsay, Peebles. The decorative modelling and granite work is by Mr. Kerr, sculptor, Haymarket, Edinburgh; and the whole has been executed under the superintendence of the designers, Messrs. Sydney Mitchell and Wilson.

SHEFFIELD.—The new schools in Carver Street, Sheffield, are being pushed on rapidly, and it is expected that the whole will be ready for opening in October. The lecture room is an airy and well-lighted apartment, 50ft. square, and has accommodation for about 500 persons. It will be used as the young men's schoolroom and for other purposes which its name implies. Above the lecture hall is another room, about the same size, which will be a joint schoolroom for boys and girls. The young women's schoolroom measures 42ft. by 30ft., and there are about thirty class rooms, the whole forming very complete premises for the Sunday school and social work which centres at Carver Street. The total cost of the building and furnishing, together with the necessary alterations to the old premises, will be from £4500 to £5000. Mr. H. W. Lockwood, of Palatine Chambers, is the architect, and the contractors are: Masons and bricklayers, Messrs. Malthouse and Ward; carpenter and joiner, Mr. Enos Moore; slaters, Messrs. Staniforth and Lee; plasterers, Messrs. Hodkin and Jones; plumber, Mr. Hickson. The buildings throughout are heated on the low pressure hot-water system, by Messrs. Newton, Chambers, and Co.

WIGAN.—A new workhouse at Wigan is proposed. The present buildings in Frog Lane do not meet present requirements. Half a dozen sites have been under survey, but the one apparently in most favour is at Orrell. Some of the above sites are within the borough, one being Whitley and another Beech Hall, both healthy parts of the town.

WELLINGTON.—New buildings have been erected at Ketley at a cost of about £3000. The school provides accommodation for 360 children, including infants. The outside elevations are effective, being somewhat Elizabethan in style. The buildings have been erected by Messrs. R. and J. Millington, builders, Oakengates, from an excellent design by Mr. C. R. Dalglish, architect, Wellington and Shrewsbury.

WESTON-SUPER-MARE.—The Weston-super-Mare Pier Company is now having constructed a pier out from Birnbeck Island to a natural basin. The length of the new pier will be 950ft., and, though the structure is to be considerably in keeping with the existing pier, it will differ mainly in the fact of width, which is to be from 14ft. to 15ft., as against 20ft., the width of the present pier. There will be refuges and side-wings, whilst the seating accommodation will also be carried the whole length. A roomy pier-head will be constructed, with the usual timber piles and fenders. The buildings and offices on Birnbeck Island have been rebuilt at a cost of £2000. The whole buildings are of solid stone, and the ventilating arrangements in every department are admirable.

YORK.—The foundation stones of a new chapel at Bishopthorpe have been laid. The style of Architecture to be followed is Early Gothic, red bricks, with stone dressings, being used. The architects are Messrs. Hornsey and Monkman; Railway Street, York, and the contractors engaged on the work are as follows: Bricklayer, mason, joiner and plasterer, Mr. Jonathan Simpson; slater, Mr. Joseph Hardgrave; plumber, Mr. J. H. Shouksmith; painter, Messrs. W. Bellerby and Sons.

Views and Reviews.

THE STORY OF THE BRITISH COINAGE.

The history of the coinage of any country always throws an interesting sidelight on the history of its Art. The history of our British coinage, as unfolded before us here, is in many respects parallel to that of our Architecture. From Greece to the Greek colonies, in Southern France, and through France to Great Britain, is the history of both in a sentence. And precisely as debased Greek forms may be traced, and Greek influence may be felt, running through early French Architecture and spreading to England, so do we see it in the coinage. Three most interesting photographs of coins serve to illustrate the point. The original Stater of Philip II., of Macedon, then the copy executed by the Gauls, the "Philippine," and, lastly, the imitation of this copy made by the Britons—the British Stater. Those interested in the subject of coins—and what artist is not?—will find this book a serious contribution to the literature of the subject. It is called "The Story of the British Coinage," but it is rather too formal in arrangement to suit the title; it is more of a handbook or concise book of reference; the introduction is the only narrative part. The reign of each Sovereign is taken in order, and every coin minted during his reign is described. About 140 pages is devoted to England, fifty to Scotland, and twenty to Colonial coinage; there is also a note on tokens, and an index. There are 108 illustrations of coins of all dates, which give us, at a glance, the history of the art of designing coins. The contrast between the fine decorative effect of such coins as the gold florin of Edward III., or the rose-noble of Henry VII., and the utter commonplaceness of those of the Georges, or of the present day, is more instructive than pleasing. The book is nicely printed, handy in size, and popular in price. It should have a good circulation.

"The Story of the British Coinage." By Gertrude Burford Rawlings. London: George, Newnes, Limited, 1898.

IRON AND STEEL BRIDGES.

This book, written primarily for students and apprentices, will be found useful by architects and engineers generally, who though not bridge specialists, carry out a good many important works of this description. The author, in his endeavour to make the principles and practice of bridge construction clear and concise, has omitted, in many instances, the reasons for his statements, giving the appearance of a hard and fast rule where only the best form for general practice is intended. In Chap. VII., on the "Preparation of Drawings," the author states: "That making an allowance for vibration is a mere farce, as there is no data upon which to base any figures." By vibration we suppose the dynamic action of suddenly applied load is meant, and here we differ from the author, as the intensity of this strain, though not absolutely known, can be closely estimated, and is a factor which should in every case be considered. In this opinion many of the principal bridge engineers in this country and America agree with us. This point is illustrated in Chapter IX., where a design for a lattice girder bridge is given 90ft. span, the strain per square inch of section being the same for both main and cross girders. Now the full load is applied to latter instantly, and a greater allowance should be made for the shock than in the former, where an appreciable time must elapse before it can be fully loaded and unloaded, and the number of applications of the load to the one is at least ten times that of the other. Before leaving this chapter, we would point out that the mode of fixing the cross girder to the bottom flange of the main girder is very indifferent, and in most recent specifications for important bridges the use of rivets in this manner is not allowed. The form of top and bottom flanges is not the best that could be adopted, as the centre lines of the bracing do not meet on the centre of gravity of the flange and produce a bending strain. Through-

out the book generally the details given show the principles involved and the practical limits of workmanship, and contain a large amount of information in a limited space. We draw the author's attention to a few errors. On page 104, where discussing the placing of rivets, diameter is used in place of radius, and a multiplication sign is used where addition is meant; on page 257 the weight of rivet heads is given as five per cent., whereas ten per cent. is allowed in the calculation; and, again, on page 259, 3½in. on one line becomes 3in. on the next. These printers' errors cause no trouble to the experienced draughtsman, but they are very trying to the student. Except that we hold different views on one or two points from the author, we have nothing but praise for the book as a whole, and it will well repay careful study by all interested in the design or construction of iron or steel structures.

"Iron and Steel Bridges." By Francis Campin, C.E., Crosby, Lockwood and Son. 3s. 6d.

Correspondence.

CARSHALTON COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—We note in your criticisms of the designs in the above competition last week two rather serious inaccuracies.

Firstly, There are no covered ways at all in our design, merely open roadways or pathways, as printed upon the plans, the food being proposed to be taken in motor vans to the different parts of the hospital along these roadways.

Secondly, It was *not* contrary to the instructions to have, as we did, larger strainers for block plan, as, according to the condition of the competition, the block plan was to be drawn to twice the scale of a very large site plan furnished with the conditions, which would have necessitated an even larger strainer.

Application was therefore made to the Board for leave to show only a portion of the site, and this was given, together with answers to other queries, so that it was open to all competitors to do as we did had they so wished; and, therefore, it is not right to say that we had any advantage over the others, or that we showed the whole of the site.—We are, dear Sir, yours faithfully,

NEWMAN & NEWMAN.

31, Tooley Street, London Bridge, July 13.

Enquiry Department.

A SMOKING APARTMENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Please describe what sort of building and what size, also what preparation for fittings, is necessary in preparing plans and specification for a house or room for smoking bacon in a provincial town for trade purposes.—Yours, &c.,

"ARCHITECT."

Perhaps a reader with experience in this style of work will reply.

VALUATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you through your invaluable columns inform me of the best book on valuing property?—Yours faithfully,

J. A. B.

It would be quite impossible to say which is the best work on valuations; but we can recommend "Valuations and Compensations," by Professor Banister Fletcher, F.R.I.B.A., D.L., &c. Published at 5s. 6d., by B. T. Batsford, 94, High Holborn, W.C.

It is proposed to erect a new Wesleyan chapel at Barwick.

A NEW Congregational chapel which has been erected in Manor Road, Scarborough, has been opened.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BEXHILL-ON-SEA.—For the erection of college buildings, Dorset-road, Bexhill-on-Sea, for Mr. J. A. Brown. Mr. J. B. Wall, architect, Bexhill:—
P. Jenkins ... £4,350
H. E. Cruttenden ... 3,940

BRIDLINGTON QUAY.—For the erection of two houses, Belgrave-square, for Mr. J. Taylor. Mr. Samuel Dyer, architect, Bridlington Quay:—
J. Blackburn ... £2,135
E. Corner ... 1,700
F. Blackburn and Son, Peel-street, Hull* ... 1,624
*Accepted.

BRIDLINGTON.—For the erection of eight houses, Waterworks-street, for Messrs. Nornabell. Mr. Samuel Dyer, architect, Bridlington Quay:—
E. Corner ... £2,600
J. Sawdon ... 1,385
J. Rennard, Bridlington Quay (accepted) ... £1,385

BURTON LATIMER.—For erecting the Britannia Club and Institute, for the Building Committee. Messrs. Mosley and Anderson, architects, Northampton:—
C. Lewis ... £1,257
A. H. Dorman ... 1,249
Bradshaw and Cooper ... 1,224
F. Henson ... 1,220
A. J. Ball ... 1,190
A. Lewis ... £1,174
A. Traynar ... 1,169
R. Marriott ... 1,165
Wilson and Albright, Northampton* ... 1,061
*Accepted.

CARDIFF.—For the erection of temporary premises for Bots Intermediate Schools, Roath. Mr. Geo. Thomas, architect, Queen's Chambers, Cardiff. Quantities by architect:—
Humphreys & Co. £3,600 0 0
T. Hawkins & Co. 2,280 0 0
Evans and Owen 3,157 3 10
S. Shepton & Son 3,057 5 0
Harbrow ... 2,980 0 0
Cox and Bardo ... 2,975 17 0
G. Griffiths ... 2,897 17 0
W. H. Ingleson ... 2,786 8 0
E. Turner and Sons ... 2,738 0 0
W. Williams ... 2,699 0 0
J. Allan ... £2,656 0 0
E. R. Evans and Bros. ... 2,600 0 0
Jones Bros. ... 2,600 0 0
H. Smith ... 2,585 4 6
Latley and Co. ... 2,532 10 0
Newman & James ... 2,500 0 0
C. Price and Son ... 2,499 0 0
W. Symonds & Co. ... 2,443 0 0
C. C. Dunn ... 2,439 8 0
H. Gibbon* ... 2,398 0 0
*Accepted.

LONDON.—For the erection of the "Alma" public-house, Parson's Green-lane, S.W., for the Royal Chelsea Brewery Company. Mr. A. Parnacott, architect:—
Lancelles and Co. ... £5,855
Ansell and Co. ... 5,678
Howell J. Williams ... 5,627
Joselyne and Young ... £5,487
Peacock Bros. ... 5,200

LONDON.—For alterations and additions to the "Prince Albert" public-house, Weedington-road, Kentish Town, for Messrs. Culley and Woodham. Messrs. Crickmay and Zimmerman, architects:—
Ransome ... £1,829
Barham ... 1,823
Charteris ... 1,753
Marchant and Hirst ... 1,773

NASH.—For pulling down and rebuilding the "Waterloo Inn," Nash, Monmouthshire, for Messrs. Phillips and Sons, Limited. Messrs. Swallow and Creighton, architects and surveyors, Steam Packet Chambers, Dock-street, Newport, Mon.:—
J. Prosser ... £1,686 0 0
J. Morgan ... 1,470 0 0
W. Jones & Son ... 1,378 0 0
C. H. Reed ... 1,300 0 0
H. C. Parfitt ... 1,298 0 0
W. Price ... 1,280 0 0
J. Linton ... 1,265 0 0
E. C. Jordan ... £1,217 0 0
A. E. Parfitt ... 1,190 0 0
J. and I. Davies ... 1,120 0 0
J. Charles, Newport* ... 1,069 0 0
E. U. Ridgway ... 1,067 13 11
J. Hooper ... 1,050 0 0
*Accepted.

PAISLEY (N.B.).—Accepted for additions to Riccarton Asylum (Male Hospital Extension for thirty-five new beds), for the Parish Council of Paisley. Mr. W. D. M'Lennan, architect, 96, High-street, Paisley. Messrs. Morrison and Matheson, measurers, 231, St. Vincent-street, Glasgow:—
Masonry.—B. Blackwell and Co., Paisley £1,059 16 8
Joinery.—J. Inglis, Paisley ... 692 18 10
Slating.—J. Jeffrey and Co., Paisley ... 109 18 1
Plumbing.—J. Martin, Paisley ... 205 6 10
Tiling.—J. Collins and Son, Paisley ... 71 5 2
Painting.—Simon Kemp, jun., Hamilton ... 59 15 0
Heating.—J. Boyd and Sons, Paisley ... 213 7 0

PLYMOUTH.—For additions to aerated water manufactory, for Messrs. Biscoombe & Son, Green-street, Plymouth. Messrs. Keats & Coath Adams, architects:—
P. Blowey ... £1,597
A. N. Coles ... 1,395
A. Andrews ... 1,307
W. E. Blake ... 1,247
Tozer and Son ... 1,228
A. R. Lethbridge and Son £1,225
Pearce Bros. ... 1,159
G. B. Turpin ... 1,148
Pearn Bros.* ... 1,145
*Accepted.

ROMFORD.—For the erection of two houses and various other works in North-street, Romford, for Mr. E. Schwier. Mr. J. Kennedy, architect, 25, Bedford-row, W.C.:—
Norton ... £2,208 0
Bell and Son ... 2,191 5
Bruty ... 2,126 0
Hosking ... 2,126 0
Hammond and Sons, Romford ... 2,093 0

RUABON (Wales).—For additions, &c., to schools, Acrefair, for the School Board. Messrs. J. Morrison and Son, architects, King-street, Wrexham. Quantities by the architects:—
J. Davies ... £2,684
J. T. Jones, Cefn, Ruabon (accepted) ... £2,175
W. E. Samuel ... 2,430
J. Gethin ... 2,072

SHERBORNE (Dorset).—For the erection of a residence. Mr. T. Farrall, architect, St. John's-chambers, Sherborne:—
Lye and Sons ... £1,729 16 1
Rowsell and Son ... 1,670 0 0
H. Gillingham, North Wootton* £1,498 0 0
G. Pitman ... 1,340 10 4
*Accepted.

CONTRACTS OPEN.

ST. GEORGE-IN-THE-EAST PARISH. TO ENGINEERS.

The Guardians of the Poor of the above Parish hereby invite TENDERS for the PROVIDING and FIXING TWO NEW STEAM BOILERS and other Works, at the Workhouse, Raine-street, Old Gravel-lane, E.

Plans may be seen, and specification form of Tender, and further particulars obtained at the office of Mr. G. A. WILSON, Vestry Hall, Cable Street, E., on a deposit of a £10 Bank of England note, which will be returned upon receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Boilers," to be sent to my office not later than TWO o'clock on JULY 22nd, 1898.

The Guardians do not bind themselves to accept the lowest or any Tender.

The contractor will be required to enter into a bond (if called upon) for the due performance of the contract, and no work will be ordered under the contract until such bond has been executed.

Persons sending in proposals must attend themselves (or by duly authorised agent) at the Board-room, Raine-street, Old Gravel-lane, E., at FOUR o'clock on the 22nd inst.

By order, J. R. BROWNE, Clerk.

Guardian's Offices, Raine-street, Old Gravel-lane, E., July 12th, 1898.

NEWHAVEN UNION. TO BUILDERS.

The Guardians of the Newhaven Union invite TENDERS for the ERECTION OF NEW KITCHEN, SCULLERY, and OFFICES, on land adjoining the Workhouse of the Union, and a CONNECTING CORRIDOR to the Infirmary and Workhouse, and for ALTERATIONS and ADDITIONS to the said WORKHOUSE.

Forms of Tender can be obtained, and plans and specifications seen, at the Office of Messrs. CLAYTON and BLACK, the Architects, 152, North-street, Brighton, or at my Office, and bills of quantities can be obtained of them or me on payment of One Guinea, which will be returned on receipt of a bona-fide Tender.

The Guardians may require the work to be done in two sections, but no Tender will be accepted to carry out either section only.

Sealed Tenders, on the forms supplied, and marked "Tender for New Kitchen and Alterations to Workhouse," must be delivered at my Office on or before JULY 21st, 1898, at SIX o'clock in the afternoon.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order of the Board, No. 86, High-street, LEWES, June 30th, 1898. WILLIAM GATES, Clerk to the Guardians.

The "Climax" Ventilating & Heating Co.

PATENTEES AND SOLE MANUFACTURERS,

SEWER VENTILATION.

AT a time like the present—writes a correspondent—when the subject of sewer ventilation is engaging so much of the public attention, a plain statement of the position of expert knowledge upon the matter may not be without interest or profit. The common conception of a sewer as a channel partly filled by a stream of decomposing filth, and partly by an accumulation of foetid gases under considerable pressure, is entirely erroneous. In a properly-constructed and efficiently-flushed sewer the contents are never stationary, and do not undergo decomposition. The air of such sewers is not markedly different from the external air as regards chemical composition, nor does it contain germs in excessive numbers or of peculiarly dangerous nature. In

BADLY-CONSTRUCTED AND BADLY-FLUSHED sewers, or in those which from subsidence or other accident the floor has become uneven so as to permit of stagnation and decomposition, the case is different. Here gases, and most offensive gases, are generated and accumulate within the system. Such gases are at a temperature higher than the external air, and may be under some slight degree of pressure, they naturally tend to accumulate in the highest part of the local drainage scheme. Their escape is effected either through some defect in the sewer, or by their forcing their way through the traps which guard the entrances of street gullies or private house drains. Offensive smells are thus peculiarly liable to be detected in the more elevated portions of the town. The question then arises, "Are such escapes of sewer-air capable of causing ill-health or of spreading definite diseases?" The question was very thoroughly discussed at the meeting of the British Medical Association in 1895, and the consensus of opinion showed that whilst the

INHALATION OF SEWER GAS

might, if continued, lead to lowered vitality, and thus predispose to infection, yet there was no evidence to show that specific infectious diseases were ever spread by this means. It has been definitely asserted that no disease-producing germ has ever been detected in sewer air, although many experimenters have attempted the task of their discovery. But even if we take it for granted that a lowered vitality and a certain degree of discomfort are the sole evils arising from the obnoxious odours, surely these two alone are sufficient to justify measures being taken to abate the nuisance. As to the nature of the remedy there can, we think, be very little doubt that the simplest and most efficacious is "sewer ventilation." Whatever may have been the opinion in 1875, at the present day sanitary authorities are practically unanimous in favour of free ventilation. The past twenty-three years have seen a marvellous progress in hygienic affairs, and the progress we cannot afford to disregard. The following report, by the Chief Engineer to the London County Council, which has during the past month been distributed for the various

SANITARY AUTHORITIES OF THE METROPOLIS, succinctly epitomises the whole matter: "In accordance with the instructions of the committee, I issued two circular letters to the engineers and surveyors of the various vestries and district boards in the county, inviting them to a conference on the subject of the ventilation of sewers, with a view to some uniform system being adopted, if possible, for dealing with complaints of offensive emanations from gratings connected with both local and main sewers. In response to the invitation, a meeting was held at the County Hall on Friday, February 25th, at which upwards of forty of the gentlemen invited were present. The discussion on the subject of the ventilation of sewers occupied a period of over two hours, and resulted in the following resolutions being passed, namely—

"1. That the closing of sewer ventilators in response to complaints increases the general evil, the diminution of which is to be attained by the multiplication of the ventilators at regular frequent intervals

"2. That in connection with any interceptor hereafter fixed on a main house drain, it is advisable to carry up a ventilating pipe from the sewer side of the interceptor, up the front, side, or back of the house, to the satisfaction of the local sanitary authority, and that the outlet drain from the interceptor shall not be flap-trapped in sewer, unless required by the local sanitary authority.

"3. That pipe ventilators up buildings, or otherwise where possible, should always be adopted, in addition to surface ventilation.

"It will be observed that the general result of the conference has confirmed the action of the committee and the Council in recent years, and that the remedy for sewer emanations is to be looked for from the maintenance of more frequent ventilating openings, both at the street level and by means of pipes carried up houses and other buildings."

Sanitary Work in Birmingham.

THE construction of underground lavatories in High Street (Bull Ring) and Corporation Street (Old Square) has been commenced by the Birmingham Public Works Committee. The work, owing to the large amount of excavation which it involves and the massiveness of the main structures, will not be completed until about October. In each case there will be a department for ladies, this being the first instance in which the Birmingham Corporation has made such provision—except in such cases as that of the Market Hall and the Law Courts. The larger of the two lavatories is that which is being provided on the open space between the Nelson Statue and St. Martin's Church. The general plan of the subterranean area is that of a triangle with the corners rounded off, and on paper resembles that of the afterpart of a ship. The length, measured in the direction of the slope, will be 50ft., and the width at the smaller end 16ft., and at the larger end 32ft. The smaller end will be towards the upper part of the slope, and at this end will be the entrance to the ladies' room. The average depth of the floor below the street will be about 9ft., and the area will be covered with glass prisms on the ground level, forming a "refuge," so that very little will be taken from the present street area. The entrances will be provided with ornamental iron railings, and upon the refuge triple street lamps. The interior of the lavatories will be faced with ivory-white glazed bricks, and the steps will be of hard York stone. The wood fittings will be of teak, and the divisions of polished rouge Royal marble. The sanitary fittings will embody all the latest improvements, including Jennings' "Century" closets, with syphonic discharge. A water-driven air-propeller will provide ventilation for both departments. In Corporation Street, the lavatory is being constructed partly under the triangular refuge round which the tramcars pass and partly under the roadway of Corporation Street. Its general plan will be, like that of the refuge—that of a triangle with hollowed sides and rounded angles. The base of the triangle running in the line of the street will measure about 46ft., and the distance from the base to the apex (which will be towards the upper part of the Square) about 33ft. The women's department will extend about 6ft. under Corporation Street, and will be roofed with Lindsay's patent steel decking, over which will be a layer of concrete supporting the wood pavement. The floor of the lavatory will be about 9ft. below the roadway. The fittings will be of teak and pitchpine with marble divisions and slabs. Doulton's automatic flushing contrivances will be used in the sanitary arrangements. The entrances will be by stone steps, protected by ornamental railings and lamps, and the refuge will be paved with glass prisms. The total cost of the two buildings will be about £4000.

The first stone of the new docks at Ostend was laid recently.

Builders' Notes.

It is twenty years ago and more since so interesting and important a military operation as that which took place recently near Chatham has been carried out. It is not probable that any of those who were present at the bridging of the Medway by the Royal Engineers in 1875 were present when the same feat was performed last week, but had there been any such, military or civilian, they could hardly fail to have been struck with the improvements in the means and appliances by which the operation becomes a less serious one nowadays, and is carried out more quickly and with a greater command of resources. The Royal Engineers at Chatham, having decided to bridge the Medway across the reach between Chatham Dockyard and Upnor, as an important feature of the course of instruction at the School of Military Engineering, some 200 officers and men set to work upon the operation last week, and on Tuesday the bridge was completed and "open for traffic" for a few hours. Major-General Fraser, the commandant of the school, had good reason to be proud of the bridge, and of the manner in which it was constructed. The site of it was deliberately selected on account of the difficulties presented by the high river wall and the deep mud on the dockyard side. The width of the river there (1190ft. at high water), the strong tide, and the difficulties which were expected from passing traffic, were also considered to be "useful factors in instruction." At the dockyard end a special form of two-legged trestle was used, each leg consisting of two spars, the road transom sliding between them, and supported by a chain or two half hitches round each spar. The largest trestle was 33ft. high. Forty-six service pontoons were used, with 217 108-gallon casks and 90 36-gallon casks.

WRITING on the subject of machinery in connection with the building trade, a correspondent says:—"Until recently less improvements have been made in the way of labour-saving appliances, &c., in our trade than in any other, but this state of affairs is coming to an end, as many of my fellow-workmen know who have seen the machinery I am going to allude to at work. For the information of those who have not, I give a description. The machinery referred to is really marvellous in its capabilities, and has been at work on a Government contract during the last two years. It does all kinds of masonry work in a far superior manner to that done by hand, in the usual way, and enables one man to do as much as fifty. It cuts and works stone ready for the building at the same speed as an ordinary circular saw cuts wood, and it does not require any further dressing or labour whatever. I understand it is intended to put these machines down in all the principal cities and towns in the United Kingdom, and supply the stone to builders and contractors ready for fixing. They will thus be able to dispense with a large number of masons. On an average, it takes a mason two hours to square and dress the ends of a piece of ashlar, or masonry, having a sectional area of one square foot. The same work can be done with the Diamond machinery in less than five minutes. The time for doing this work by hand labour, as at present, is over 2000 per cent. more, and the actual cost 400 per cent. more than by the Diamond machinery.

"ONE of the most important of the many exceptional advantages presented by this system is, that it is not necessary to spend a large sum in the erection of costly buildings, and enormous quantities of expensive plant and working tools, as is the case in almost every other industry. The whole of the machinery and plant can be taken down, removed from one place or district in a city, town, or part of the country, to another, at a trifling cost, the only buildings required being merely sheds or covers as protection against the weather. Such a saving of labour has not been effected since the introduction of the power-loom or spinning-mule. The machinery

is also capable of producing bow or bay windows without any hand or manual labour whatever, except the machinery attendant. Thousands of those windows are now being put into cottages annually, and they can be produced complete, and sold ready for the building, at a cost of 50 per cent. less than they can be made by hand as at present. This marvellous machinery will affect our interests as seriously as the steam power-loom did the hand-loom weavers. I hope my fellow-workmen will not play into the masters' hands by compelling them to fight us with our own tools as it were—they will do that fast enough in their own interests in any case."

THE Bill promoted by the Chelsea Electricity Supply Company Limited was further considered last week by the Select Committee of the House of Lords. The Company seeks powers to compulsorily acquire additional land adjoining the site of the present works in Alpha Place and Flood Street, Chelsea, to erect generating stations, and for other purposes. The Bill is opposed by the Chelsea Vestry, the London County Council, Earl Cadogan, and other owners, lessees, and occupiers in the neighbourhood. The main objection is the alleged vibration already caused by the present generating station. Some evidence was given to show that incessant rattling of windows and doors was caused while the engines were working, and there were cracks in the walls and ceilings. Grit, soot, and smoke from the chimney shaft were also complained of, and that on account of the nuisance the value of property in the neighbourhood was greatly depreciating.—Mr. Thomas Holland, clerk to the vestry of Chelsea, in view of the report of the joint committee on electrical energy, suggested that the Company should establish its large generating station outside London, and use its present site merely as a distributing station.—Mr. Balfour Browne, Q.C., in his reply for the promoters, said that this was the first case in which an electricity company asked for compulsory powers to acquire land. Under compulsory purchase surrounding owners had the right to be heard in opposition, whereas under purchase by agreement they had no such right. If their opposition was successful no nuisance could be created.—The Committee decided that the preamble of the Bill was proved.

THE completion of the Great Central Railway line into London will bring about a great transformation at Neasden, one of the North-western suburbs. At Neasden a new railway town is being created which in the near future will vie in importance with Willesden. Some forty or fifty neat cottages have already been completed, and the foundations of perhaps as many more have been dug. Not far from this is a great engine-shed capable of accommodating thirty-six engines, and equipped with fitting shops and other adjuncts of a locomotive centre. Elsewhere work is proceeding on another large structure which is ultimately to be used as a carriage shed for the housing of the Company's surplus rolling stock, while all around, over an area of sixty acres, is a maze of sidings into which the goods traffic as it comes from the North will be poured. In preparing the site for its future purpose some great engineering works have had to be executed. One of these was the construction of an aqueduct 200 yds. long, with two openings of 10 ft. in diameter, to provide for the water of the River Brent, which flows through the site. Another and more important project still in hand is the provision of a main, 10 ft. in diameter, in connection with the great scheme of the New River Company for the enlargement of their water supply to the metropolis. A small army of workmen are engaged on this last-named project. When finished it will be covered over with soil to the depth of several feet, and the future traveller on the line will not suspect that beneath the busy goods yard of the line flows a very considerable portion of the water supply of London. Most of the arrangements necessitated by the coming opening of the line are well advanced. But it will be a long time yet ere the place assumes its completed aspect.

Surveying and Sanitary Notes.

AT Colne a Local Government Board inquiry has been held into the application of the Borough of Colne for sanction to a loan of £24,400 for works of private street improvement, and £4200 for the erection of stables.

EVERYBODY knows that Russia's railway system is being extended with great rapidity. In Europe, according to one of our consuls, she is computed to have more than 2000 kiloms. of lines under construction, whilst in Asia the work of connecting the chief centres is being pushed forward with much rapidity. The line connecting Vologda with Archangel, 640 kiloms. in length, is completed, or nearly so, and, before the end of 1898, 700 kiloms. should be contributed towards the completion of the Moscow-Kiev-Voroneje net. A very extensive scheme for the construction of light railways throughout the Empire is also said to be in contemplation.

AT the Surveyors' Institute, Savoy Street, last week, Mr. James Green, the arbitrator appointed by the Local Government Board, sat to determine the value of the property within the area of the Tottenham Court Road improvement scheme. The first case considered was that of Messrs. William Henry and Richard Baker, lessees of the premises, No. 4, Tottenham Court Road. Mr. Vigers and Mr. Horne, surveyors and valuers, estimated the value of the lessees' interest at £23,403. For the County Council, Mr. Andrew Young and Mr. Wilkinson valued the interest at £21,384. The next case, No. 2, Tottenham Court Road, the property of Mrs. Amelia Lansdale, was agreed to, the value being fixed at £3232. In the case of Mr. Gardner, lessee of 4, Oxford Street, and premises at Bowes' Court, the County Council agreed that there was no value, and no evidence was offered. The premises, No. 9, Bowes' Court, and 1A, Tottenham Court Road, the property of Hay's executors, were valued by Sir John Whittaker Ellis at £22,600. Mr. A. Young and Mr. Wilkinson estimated the value at £14,960.

PROVIDENCE having now blessed our Metropolis with beautiful summer weather, the local authorities—those at least who are charged with preserving it bright and clean—are naturally doing their best to counteract the gifts from above by keeping the streets under our feet as dusty and offensive as possible. One might reasonably suppose that the Strand and Fleet Street are sufficiently important thoroughfares to merit being thoroughly cleansed and purified before the full work of the day begins, but so far from this being the case, the humble scavenger may be found busily at work up to ten or eleven o'clock, eagerly qualifying for an increase of pay by filling the air as thickly as he can with microbes. The streets mentioned are not the only ones where this system of increasing the burden of tropical heat by dust and nauseous odours at untimely hours prevails, but they may be taken as types. All kinds of refuse are brought down from the courts and alleys in the neighbourhood, and have to be carted away in the full blaze of the sun. Surely the sanitary authorities could easily arrange to complete all such work at a reasonably early hour in the morning, before the everyday life in London is in full swing and in this way add to the amenities, as well as the health of the capital.

THE Bill promoted by the Metropolitan Railway Company seeking power to acquire lands for the further ventilation of their system was recently under the consideration of a House of Lords committee, over which Lord Brougham presided. The petitioners against the Bill were the Paddington Vestry, the Great Western Railway, the St. Marylebone Vestry, the St. Pancras Vestry, and the London County Council. Mr. Littler, Q.C.,

for the promoters, said the object of the Bill would command the sympathy of all travellers on the Metropolitan Railway. When the line was constructed the idea was to use hot-air engines, but they were found to be perfectly hopeless, and the ordinary locomotive engines were resorted to. All along the company had been anxious to improve the ventilation. Fans, extremely costly and inconvenient, were introduced for this purpose, but, as proceedings were commenced by objecting parties, ventilation holes were tried. To these the local authorities had been opposed, contending that the Company should acquire land which the local authorities did not need for their own purposes in order to improve the street communication.

THE whole matter had been before the House of Lords, and dealt with by a departmental committee over which Sir Francis Marindin presided. This committee concluded that the most satisfactory method of dealing with the ventilation of the Metropolitan tunnels would be by the adoption of electric traction. In view of the probable adoption of electric traction in the near future, the committee, as a temporary measure, recommended the construction of additional openings, which would be found useful even when the line was worked electrically, but only upon the condition that, unless the electric traction were adopted, or some satisfactory artificial ventilation introduced within three years, it should be incumbent upon the Company to close them if desired by some competent authority. This recommendation of a temporary measure the Company were now seeking to adopt. The time had not arrived when it would be wise to substitute electric traction for the present means of locomotion, but arrangements were in process with the District Railway for experiments to that end. The improvement now sought was purely in the interests of the travelling public, for which the Company were prepared to spend £80,000.—Colonel Bell, the chairman of the Metropolitan Company, said that arrangements had been concluded with the Metropolitan District Company for the experiments with electricity.—Sir Benjamin Baker stated that the electrical experiments referred to would occupy at least twelve months.

THE Royal Commission appointed to inquire into the question of the Metropolitan Water Supply sat last week at the Westminster Guildhall, Lord Llandaff presiding. Mr. Bigwood, M.P. for the Brentford Division of Middlesex, gave evidence with respect to the companies that supplied Middlesex. Asked by the chairman which of the companies drew water from sources in Middlesex, the witness said he believed that all of them did. The New River Company drew from wells and from the Thames; but he did not think either the West Middlesex Company or the Grand Junction Company had wells. Mr. Bigwood, continuing, said he understood that the New River Company had no statutory powers with regard to wells, but drew as landowners. Middlesex had petitioned against the various purchase Bills that the London County Council had introduced. The County pleaded for non-interference, as it was perfectly satisfied at present.—The Chairman inquired whether Finchley was satisfied, whether the locality was properly supplied at present.—Mr. Bigwood said it might be that the supply to Finchley was inadequate, but there was no reason why it should be. If the supply was inadequate it would, he believed, be easy to remedy it. He did not personally favour the purchase of the water undertakings by any one. The feeling in Middlesex was that they were perfectly satisfied with their present position, and no fears were entertained for the water supply in the immediate future. It was the opinion of the County that there was an ample supply under their own soil without going elsewhere. Mr. Bigwood expressed himself in favour of the water companies being placed under a board of control, which should be composed of representatives of the County Council, the district council, the water companies, and the Government, the last to be in the majority.

MANCHESTER AND ITS BUILDING TRADES EXHIBITION.

By G. LL. MORRIS.

MANCHESTER might reasonably be called the capital of the cotton towns, for it is essentially the visible and highest expression of the life which animates the Lancashire "hell-holes," as Cobbett aptly named them. That life, for the most part, is sordid, cheap, and dirty; and Manchester, its principal outcome, remains the great achievement and triumph of cotton industry. Passing

STAINED GLASS FOR A YORKSHIRE HOTEL.
BY WALTER T. PEARCE.

through the streets, seeing the wares on sale, the places of amusement, and visiting the buildings, we but find the spirit of the cotton town in a more exaggerated form: much vulgarity, ostentation, and imitativeness, but very little that is sweet and pleasant, fresh and vitalising. The Manchester man's ideal pleasure house seems to be Belle Vue, his god mammon,

GLASS AT MERCANTILE BANK, MOSLEY STREET,
MANCHESTER. BY WALTER T. PEARCE.

and his arts and handicrafts are realised to his complete and complacent satisfaction in his restaurant, his pub, his music hall, and his chapel. Manchester folk have just concluded an exhibition at St. James's Hall, where there was gathered together what we may presume is representative of Manchester's building trades

and decorative arts. It was a poor show, but, under the circumstances, better, perhaps, than we could have believed possible in the City of Manchester; for, amid much which was dull and uninteresting, were a few stands claiming some attention.

C. W. WILLIAMS,

of Carr Street, Manchester, had two or three interesting exhibits. One of them was a very good chimneypiece, designed by C. H. B. Quennell. It is made in oak, fumigated apparently, and then stained. Two broad and square-like looking pilasters at either end extend without interruption from the base mould to the large projecting cornice at the top. Small columns are placed upon the outer edge of the mantelshelf, and finish under the principal moulding. Some of the later work by this architect seems to lack the careful thought which has evidently been bestowed upon this design. The grate set in the green brick had been very well arranged by C. W. Williams, with a broad border of copper isolating the grate from the bricks, both harmonising satisfactorily with the dark woodwork; it would have been better possibly if the copper was less highly finished, and not raised so much above the surface of the green brick.

At the same stand were some tiles designed by C. Voysey and arranged by C. W. Williams for dados. One scheme is called "the sea, the earth, and the sky," and consists of a number of plain tiles of a blue colour in the lower part of the dado; these run four courses in height, above are two more courses of the same colour, each alternate tile having a ship upon it with red flags flying, dark yellow sails bellying out before the wind; above this again is another row of a purplish brown colour, covering about a third of the surface, this, we imagine, represents the earth. This is completed with three more rows of very faint blue tiles, every other one filled with a bird dark blue in colour; the bird is on the wing. The whole effect is interesting, but hardly perhaps so satisfactory as the arrangement next to it, a really beautiful design, in which a fish and leaf is introduced in harmonies of green upon each tile.

MARTEN VAN STRAATEN'S

enamelled tiles close to this stand are rather good in colour; the mottled effect produced being not unlike the Lethaby green brick.

MESSRS. JOHN HARRIS AND SONS,

of Cockermouth, exhibited a number of their flax specialities and embroideries. Among the ecclesiastical embroideries is an exquisite altar frontal, and also examples of antependiums, stoles, veils, &c. This firm also exhibits a new Cumbrian art material, suitable for portière, curtains, &c., and flax silk cloth, artistically woven together; it is claimed that this fabric is absolutely uncreasable, and drapes perfectly. Another among Messrs. Harris's specialities is their flax embroidery threads, which are made in over 300 shades. Altogether, these embroideries show considerable originality of design, artistic execution, and taste in colour.

GEORGE WRAGGE,

of Salford, Manchester, exhibited some good metal work in copper, brass, pewter, iron, and bronze, all carried out from designs by Edgar Wood. If we are unable always to admire this architect's use of forms suggested by flowers and foliage for treatment in metal, it is impossible to deny that his fertility in design is linked to a knowledge of the material. At the same time a little more restraint would not be amiss on the ironwork at this stand. Another interesting stand is that of

WALTER T. PEARCE,

12 and 14, Albert Street, Manchester, who showed several kinds of leaded light work. In both design, colour, and workmanship, this glazing has characteristics which distinguish it from the ordinary "commercial artist in stained glass" type of design. In some of the exhibits, opalescent and Venetian glass had been introduced—in one particular instance, realising a very beautiful effect. The

use of a lead, narrow in width and semicircular in section, has been adopted when the glass is in small pieces, the little distance between the leads preventing any wiriness of effect. When the glass covers larger surfaces, the use of the narrow lead seems unsatisfactory; to obviate this, two or three widths are occasionally used in the same window. In ancient lead-glazing a broad and flat lead was almost universal, and there seems no reason why it should not still be adopted in simple work. (We illustrate some of the simpler designs.) The Vitreum mosaic shown by the same artists, and intended as "a permanent decoration for friezes, panels, dados, &c.," has possibilities, if we may judge from the examples, but at present their success in this direction seems tentative, and awaits

STAINED GLASS FOR A YORKSHIRE HOTEL.
BY WALTER T. PEARCE.

future developments before it can be considered altogether satisfactory.

MORRISON, INGRAM, AND CO.,

sanitary engineers, exhibited baths, lavatories, and sanitary fittings of all kinds. The white porcelain basins and the brass taps and fittings are inoffensive and suitable for their

GLASS AT MERCANTILE BANK, MOSLEY STREET,
MANCHESTER. BY WALTER T. PEARCE.

purpose, but where they have endeavoured to, make beautiful the woodwork and the necessary ironwork surrounding the actual appliances, the result has been disastrous. This criticism applies to other exhibitors. The ventilators shown by

J. HAMILTON,

ventilating engineer, Rochdale, for instance,

are not pleasing in design, and, while their effectiveness as ventilators may be very satisfactory, their beauty might be enhanced without detriment to their usefulness.

JABEZ THOMPSON,
Northwich, exhibited an example of "ornamental" brickwork. The ornament is weak and the mouldings coarse.
Doulton, John Jones, and the Victoria Stone Company, are the names of other firms who exhibited. The buildings erected of late by the architects of Manchester are illustrated by a number of poor drawings; of the Architecture, it would, perhaps, be more charitable to pass by in silence. We may add, perhaps, without being accused of partiality, that we almost prefer the architectural room at the Academy. Manchester has yet a great deal to learn in the Arts and handicrafts.

FROM the evidence given by M. Gaston Cadoux, the Chef de Bureau at the Prefecture of the Seine, before the Royal Commission on London Water Supply, says the Hospital, it would appear that a very interesting bacteriological experiment is periodically tried in Paris on a very large scale. People in Paris have a double water supply, spring water used for drinking and domestic purposes, and Seine water for municipal purposes. The pipes are quite separate and distinct. Unfortunately, however, the spring water is apt to run short, and when this happens they have to pump Seine water into the spring water reservoirs. "They have to pump up the bad water, if I may use that term, into the reservoir, which is generally full of pure, good water," and send it along the pipes that should have pure water in them. Now, when this is done the pipes become infected with the bacteria carried by the Seine water. The result is curious. When they turn spring water into the pipes that have been carrying river water an enormous development of bacteria occurs. Then, after the pure water has gone through the pipes for two or three days the development ceases, all of which is in accordance with well-known bacteriological experience. Perhaps it is something of the same sort that happens now and again when London water is found temporarily to contain large numbers of microbes. Not that the London water companies turn their water into dirty pipes. But if an "infection" of pure water by dirty pipes will produce such an enormous development of microbes, an "infection" by the passage of a little unfiltered or ill-filtered river water would have the same effect. When great numbers of microbes are found in London water, as does happen now and again, it is not necessary to imagine that all these have passed the filters. Only a very small number may have got through, but sufficient to inoculate the mass, just as the trace remaining in the pipes of Paris infects the pure water flowing through them. It is of small use to have pure water as a general thing, if it is left subject to occasional pollution even by comparatively small quantities of unfiltered river water; for, small as it may be, the microbes it contains will, as M. Cadoux says, "multiply enormously" in the pure water, and thus defile it.

REMOVING A MOUNTAIN.

BY A SPECIAL CORRESPONDENT.

NOW that the tourist season has well set in, the Lake District tourist will be turning his thoughts towards the neighbourhood of Keswick, and it may be that as he goes along that little railway known as the Cockermouth, Keswick, and Penrith line, he will have his eye upon the precipitous sides of Blencathra, as he runs down from Troutbeck Station to Threlkeld. The view, it must be granted, is sufficiently fine to attract the attention of the most unæsthetic, but on the other side of the line, as the train approaches Threlkeld Station, there is to be seen a sight of a different kind. Here the mountain is not in its primitive simplicity, for the sides are scored from the effects of many blasts of quite another kind than those that beat upon Blencathra, and the face of the rock is even more precipitous than is the face of the opposite fell. Here the mountain is being gradually removed

FOR THE SAKE OF THE MATERIALS of which it is made, and the granite is being broken up for an immense variety of purposes, not the least important being the provision of "ballast" for the line of the London and North-Western Railway, which takes away every day about 200 tons of Threlkeld granite for this purpose. Here is the quarry of the Threlkeld Granite Company, whose works are extending at a rate that only those who go past them frequently are able to fully comprehend. From the small affair of a few years ago it has now become an extensive undertaking. The area of the quarry is about 700 acres, and the rock will last, at the present rate of output, for at least 200 years. This, at any rate, will afford labour for mankind for a little while, even if the workings are then exhausted—and it is scarcely likely that they will be. But the special interest of the works at the moment lies in the fact that of late there has been here introduced the making of ornamental granitic tiles from the fine granite obtained in the process of other operations, and here again, as we have pointed out more than once, the secret of prosperity seems to lie in the use of waste products. Tiles were long ago to be made from this fine granite, but the problem has all along been to avoid

THE TROUBLESOME EFFLORESCENCE that was so fatal an impediment in the process. This has now been overcome by means of a German method, the patent rights of which have been secured by the Threlkeld Granite Company, who are now making at these works granitic tiles of the most varied designs and colors, without any of the erewhile troublesome efflorescence. The first item in point of nearness to the station is the great shed in which the flags of artificial stone (granite-concrete) are made, and it is interesting to note that in this shed, which is just 2000 yards in area, there are made 2000 super yards of the slabs every week. These slabs go to many of the greater towns and cities in the country as pavement for the footways, and the company is always unable to keep up with the demand for them, so popular are they amongst the public bodies in the country generally, especially in Yorkshire, even though the county has no small supply of stone of its own. Bradford and Leeds are flagged with these

Threlkeld slabs, as well as many smaller places. The fact of the supply being behind the demand seems strange, in view of the fact that a stock of these flags is always to be seen at the staging of the quarry, ready, apparently, for loading in the trucks that the railway company takes care to keep ready for the work, but the fact is that they are kept three months to mature before they are sent away, and the stacks seen are stacks of maturing goods rather than of goods ready for despatch. The technical description of the granite is syenitic, but it will be helpful to the general reader to be told that it is of the same kind

AS CLEOPATRA'S NEEDLE,

and as impervious to every kind of atmospheric influence. No antiquated or clumsy methods are in use in this quarry. Thanks to the energy and ability of the engineer and manager, Mr. Bragg, the whole of the rock drills, as well as the engine in the ornamental tile shed, are driven by compressed air, and the works are lighted throughout by the electric light. Compressed air drills are to be seen, and also heard (of this there is no possible doubt whatever), preparing the boulders of granite for the introduction of the powder charges that rive them apart. I asked Mr. Bragg if they did not use other explosives, but he told me that they found powder the best, because it gave a better and more complete break-up than other or higher explosives. Dynamite, of course, with its tremendous down stroke, is out of the question, as it shatters the rock too much, rendering it useless for getting out blocks for setts, kerbing, &c. The Threlkeld granitic tiles, by the way, are now being laid at the new Whitehaven Post Office, and at a new conservatory at Lowther Castle for the Earl of Lonsdale. Indeed, if the tourist, with whom I started my observations, will devote a morning to this quarry, he will be wonderfully interested in watching the process by which one of the Cumberland mountains is being broken up and distributed over the country generally.

THE corner-stone of the Nottingham General Hospital Extension has been laid by the Duke of Portland.

ONE of the Local Government Board inspectors recently held an inquiry at the Town Hall, Colchester, as to the application of the Colchester Corporation for sanction to a loan of £500 for the improvement and widening of Maldon Road at its junction with Crouch Street.

A NEW locomotive engine, from the designs of Mr. W. Worsdell, has just been completed at the Gateshead works of the North-Eastern Railway Company. The engine is of the triple expansion type, and it may be noted in passing that this system of steam utilisation is likely to attain as high a popularity in locomotive engineering as it has already achieved in connection with marine work, the realisation of high speeds, without added waste of space or material, being equally desirable in both cases. The North-Eastern Company's new engine is much larger than the type of locomotive in general use, and, with its tender, will weigh about 80 tons. It is expected to take heavier trains at a much higher rate of speed than is possible of attainment with any of the present type of engines, and eighty miles an hour is talked of as within the scope of its capabilities.

Property and Land Sales.

HAMPTON AND SONS,
ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.

HAMPTON AND SONS beg to announce that their AUCTIONS of LANDED ESTATES, Town and Country Residences, Investments, Business Premises, and other Properties are held MONTHLY, at the Mart, Tokenhouse-yard, E.C.

Auctions can also be held on other days in town or country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.

July List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to **HAMPTON AND SONS (Ltd.)**, 1, Cockspur-street, S.W., or by post, three stamps. Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

Sale of the outlying portions of the Sussex Estate of Sir James Duke, Bart.

Valuable small sporting properties, numerous farms, several of which are well wooded and provide excellent sites on high ground, suitable for the erection of gentlemen's residences. Rich marshes, woodland, accommodation holdings, cottages, &c., extending to about 3000 acres, and lying in the parishes of East Hothly, Framfield, Hailsham, Bexhill, Chiddingly, Arlington, Hellingly, Hurstmonceux, and Hove, within driving distance of Eastbourne and Lewes. The various properties are let to substantial tenants and will be offered in numerous lots, providing a rare opportunity for acquiring sound landed investments, and choice positions for forming small residential estates in this favourite part of Sussex.

HAMPTON AND SONS will SELL by AUCTION, at an EARLY DATE (unless previously sold by private treaty), the above valuable ESTATE in numerous lots.

Full particulars, with plans, of the Vendors' Solicitors, Messrs. PONTIFEX, HEWITT, and PITT, 16, St. Andrew-street, Holborn-circus, E.C.; of Messrs. DRAWBRIDGE and ANSELL, Land Agents, Haywards Heath, Sussex; and of the Auctioneers, **HAMPTON AND SONS**, 1, Cockspur-street, London, S.W.

FINCHLEY-ROAD.

Occupying a pleasant position in this favourite residential locality. For SALE, the conveniently placed, Double-fronted, Detached FAMILY RESIDENCE and STABLING, known as Bishop's Lodge, 35, Finchley-road, N.W., substantially built, and standing well back from the road, approached by a carriage sweep; held for 39 years unexpired from Michaelmas next, at a ground rent of £20 per annum; possession on completion of the purchase; also the well-placed and attractive Semi-detached HOUSE, No. 5, Finchley-road, N.W., containing six bed rooms, bath room, three reception rooms, conservatory, and usual domestic offices, let upon a five years' lease from September, 1897, at £90 per annum, thus forming a good investment; held on lease having an unexpired term of about 23 years, at a ground-rent of £11 per annum.—Agents, **HAMPTON AND SONS**, 1, Cockspur-street, S.W.

HAMPSTEAD, situate on high ground, towards the Heath, commanding extensive views within a few minutes' walk of Hampstead Heath station, and an easy drive of the City and West End.—To be SOLD the Valuable FREEHOLD RESIDENTIAL PROPERTY known as Rookwood, Green Hill, Hampstead, comprising a substantially-built, medium-sized residence, standing well back from the road, surrounded by its own charming grounds, with lawn, flower beds, and containing some beautiful old trees, lodge at entrance, and excellent detached stabling, the whole extending to about an acre.—Detailed particulars of the Agents, **HAMPTON AND SONS**, 1, Cockspur-street, S.W.

OFFICES: 1, COCKSPUR-STREET, S.W.

Longbridge-road Estate, Barking.

Remaining Portion, at low reserves, to close the Estate.

MR. JOHN H. BETHELL will SELL by AUCTION, at the PUBLIC OFFICES, East-street, Barking, on THURSDAY, JULY 28th, 1898, at 7.30 o'clock in the evening precisely, 115 lots of valuable FREEHOLD BUILDING LAND, including ten shop plots, with frontages to Longbridge-road, Fanshawe-avenue, and Montague-avenue. Possession on payment of a deposit of 10 per cent., balance payable in five years. Free conveyances. The land is free title and land tax. The estate is situate in a good position, adjoining the Public Recreation Ground and Barking Railway Station, from whence there is a good service of trains to the City. The roads are made, sewered, and kerbed, and the subsoil is a deep bed of gravel. There is a large demand for houses, which let and sell very readily.

Particulars, plans, and conditions of sale to be obtained of Messrs. SAVERY and STEVENS, Solicitors, 2, Brabant-court, Philpot-lane, E.C.; or the AUCTIONEER, 31, Liverpool-street, E.C., and Estate Offices, Upton Park, E.

Unusual opportunity of acquiring a high-class Marine Freehold Residence at Bognor-on-Sea.—Purchasers need only pay a deposit of 10 per cent., the balance by half-yearly instalments extending over nine years.—The imposing House, No. 2, Park-terrace, in an exceedingly pleasant position on the esplanade, facing the sea. It contains eight airy bedrooms, four spacious reception rooms, and ample domestic offices. Suitable for a high-class boarding house. Also Freehold Houses, 3 and 4, Lansdown-place; let at £65 and £70.

MR. GEORGE F. HARRINGTON will SELL the above by AUCTION, at the MART, London, E.C., on JULY 26th, at TWO, in three lots.

Particulars of W. J. MYATT, Esq., Solicitor, 23, Abchurch-lane; and of the AUCTIONEER, 16, Abchurch-lane, E.C.

Postponement of Sale.—By order of the Secretary of State for War.—The old Militia Barracks, Bethnal Green.—Leasehold.—Extensive modern Premises, having a frontage of about 75ft. to Globe-street, running through to, and including No. 21, Victoria Park-square, with frontage of 34ft. or thereabouts, area about 20,500 sq.-ft. With possession.—Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, AND CO. beg to announce that the SALE of the above valuable PROPERTY is POSTPONED until the autumn season.—29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

Auction Sales, 1898.

MR. GEORGE BRINSLEY will hold his Monthly AUCTION SALES, at the MART, Tokenhouse-yard, E.C., for the year 1898 on the following days:—

Wednesday, July 20.

Wednesday, Aug. 24.

Wednesday, Sept. 21.

Wednesday, Oct. 19.

Wednesday, Nov. 16.

Wednesday, Dec. 14.

Landed Estates, Town and Suburban Houses, Building Land, Ground Rents, Business Premises, Reversions, Shares, and other Properties for absolute Sale, will be included in these sales on reasonable terms, which can be fixed beforehand if so desired.

Auction and Survey Offices, 30 and 31, New Bridge-street, Ludgate-circus, London, E.C. Established 1852. Telephone Number, 661, Bank. Telegrams, Bridging, London.

George-lane, South Woodford.—The Grove Lodge Estate, only a few yards from George-lane Station, and 18 minutes from Liverpool-street.—Second portion of this exceptionally ripe Freehold Building Estate, particularly suitable for good villa residences, which are so difficult to obtain in this favourite district. Immediate possession for building on payment of deposit; balance payable by instalments. Free conveyances.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at the GEORGE HOTEL, High-road, South Woodford (opposite the estate), on WEDNESDAY EVENING, JULY 27th, at 7.30 o'clock, 34 plots of valuable FREEHOLD BUILDING LAND (title and land-tax free), possessing important frontages to Waverley and Eastwood-roads, George-lane, South Woodford, and comprising unquestionably some of the choicest sites now obtainable in this neighbourhood.

Particulars and plans may be had at the place of sale; of W. S. WITHERINGTON, Esq., Surveyor, 33, Great Tower-street, E.C.; Messrs. JENNINGS, SON, and ALLEN, Solicitors, 69, Leadenhall-street, E.C.; and of the AUCTIONEERS and LAND AGENTS, 67 and 68, Cheapside, London, E.C., and High-road, Leytonstone.

MESSRS. GREEN and SON,

AUCTIONEERS and SURVEYORS,

28 and 29, St. Swithin's-lane, London. Beg to announce that their SALES by AUCTION of FREEHOLD, LEASEHOLD, and COPYHOLD PROPERTIES, Ground Rents, Life Policies, and Reversions take place at the MART on the LAST FRIDAY in the MONTH, and on such other occasions as may be arranged.—Particulars are invited 21 days prior.

MESSRS. GREEN and SON undertake SURVEYS and VALUATIONS of LAND and HOUSE PROPERTIES, as well as Machinery and Plant, for

Ratings, Compensations, Partnerships, Assessment Appeals, Estate Duties, Dilapidations, Fire Losses, Mortgages, and other purposes. Estates managed and rents collected under Receiver-ship and other powers.

FREEHOLD BUILDING LAND.—TO BE

SOLD, a valuable BUILDING SITE, with extensive frontage to Lordship-lane, East Dulwich, and having an area of over 45,000ft. super. Suitable for the erection of a school or public building. Price £2000. Also several smaller plots, prices £140 to £600.—Plans and particulars of Mr. A. R. VIZARD, 12, Regent-street, Pall-mall, S.W.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ARCHITECTURAL INSTITUTE and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, personally or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

WATERPROOF COVERS, made from very best Navy canvas, 12ft. by 9ft, 15s.; 15ft. by 9ft., 18s. 9d.; 15ft. by 12ft., 25s.—Any size, at 1s. 3d. per square yard, can be sent on approval from H. J. GASSON, Government Contractor, Rye.

MARBLE.—Victoria or Cork Red, in blocks, from Viscount Middleton's quarries.—For sizes and prices at nearest export, apply to J. PENROSE FITZGERALD, Estate Office, Middleton, co. Cork.

TO LET, well-known QUARRY in Midlands, of high-class Building Stone. Advantageous terms.—Apply Box 779, Office of BUILDERS' JOURNAL.

"WHICH IS THE CHEAPEST?"—This Work consists of a complete variety of PLANS of SINGLE-FRONTED RESIDENCES, all worked out on an equal basis, with Quantities for ascertaining which is the cheapest: 25 coloured plates. Half imperial size, 25s.; with folio, 28s. 6d.; bound in book, 30s.—J. J. RAGGETT, 88, Colmore-row, Birmingham.

An Architectural Causerie.

Verbum Sat
Sapiendi.

THERE is a certain well-worn metaphor, which is used somewhere

in one of Stevenson's early essays, and carries a flavour of having been born in the pages of the late Dr. Smiles, to the effect that opinions are but milestones on the road to knowledge. From this one has computed the road to knowledge to be, at best, an unconscionable long one; but, when one considers the number of opinions one has successively embraced and discarded, it becomes clear that one must, in reason, be now very nearly *there*. This flattering hope stimulates one to set down the very latest of one's new-found opinions without reserve, and with considerable confidence and satisfaction. One is convinced then that there is great future for the architectural model, and, in particular, a brilliant future for those young, enthusiastic architects who shall first avail themselves of the full possibilities and uses of the architectural model—to those, in short, who are in the van of this new development in the Profession. One says "Profession" (not Art) advisedly. The architectural model has, no doubt, certain functions in assisting the architect to refined and well-proportioned design, but these functions are few, and the advantages of the model are scarcely commensurate with the expense and labour entailed in its manufacture, for a capable architect could judge more truly the effect of his building from plan, section, and elevation, than from a model, unless such model were minutely and accurately finished. Indeed, the only real use to the architect of a model would be to help him to a study of the skyline, and the grouping of the parts from various points of view; a consideration which would apply only to a certain few buildings of monumental character. Many, however, would not hold their design assisted, or their confidence assured, by the preparation of a model. No; the value of the architectural model applies, as has been said, not to the artistic, but to the professional phases of Architecture, and the point of view is well expressed in an aphorism lately spoken by one's predominant partner. It was a disgraceful thing for an architect to express, but it is intensely and wonderfully true, and as it will annoy him to read it here, one will write it in:—"Art be bothered, I want a client." Herein, then, lie the great possibilities of the architectural model—to catch clients withal. It rests entirely with architects whether, at next year's Royal Academy Exhibition, the year's output shall find public consideration only in the heavy wandering eyes of the faint and tired ladies who go to the architectural room to rest in the empty seats, or whether the Profession is represented by work which shall form one of the chief centres of attraction, where the voices of possible clients and their daughters may be heard at any time throughout the exhibition exclaiming delightedly, "Oh, how sweetly pretty,"

"What a *dear* little house." "Who's the artist that did it?" and similar hope-inspiring expressions. To secure this end the architect must no more draw his designs but model them, or procure models to be made. This sounds a costly and troublesome proceeding, but it is not without advantages. For instance, it would not be necessary—indeed it would be futile and ridiculous—to design a building in plan and section. One's idea is that these models should be simply fancy designs, and as they would be governed by none of the rude necessities which handicap an architect in planning an actual building, they should be very fancy indeed; they should have no plans, but be pure idealised Architecture. If a client came and said, "build me a house like that," well, of

upper windows, as has been so well conceived to give "fuss" to a perspective drawing. Of course the doors and windows would open—or some of them—it would be irresistible; and shall one say a scrap of black cotton wool in each chimney pot? Well, well; that must be for each individual artist to decide, but one would certainly warn the architect against wooden smoke, which fails when seen edge on. In all seriousness, one has no manner of doubt that if a young man of reasonable ability used his discretion in thus bringing his designs before the public in a form which it can appreciate and understand, he would soon get him clients galore. There are quantities of people who are ready to buy whatever pleases them, and would as readily

CEILING OF QUEEN ANNE'S DRAWING ROOM. BY VERRIO.

(Re-published from Law's "The Royal Gallery of Hampton Court.")

course that client would not get a house like it, but one sees no cause for uneasiness in this, as even under the present orderings of the Profession, it yet remains to be seen that a client ever has got quite what he wanted. One would suggest that the models should be to so small a scale as might be consistent with moderate cheapness so as to fascinate the beholder as a trinket or a little mechanical toy does. The models should be coloured in highly concentrated tints, and duly finished with a realistic setting. One would almost venture as far as a chair on the verandah. Anyhow, there would be smooth green lawns of billiard cloth and flower beds, and the architect might put in a great deal with clipped yew hedges, and cloths and ivy geraniums frothing and tumbling out of the

purchase, say, a cottage for the estate, or a boat-house for the lake, if it delighted them, as they would a hat. One recalls that there is in a model always a certain fascination and a seductive charm, which is difficult to analyse or explain, but which, to the superficial observer at least, decks the object with apparent attractions which are lacking in the reality. One quite expects to see these hints acted upon, and next year, or maybe the year after, the Profession will crowd to Burlington House to see Mr. Voysey and Mr. Briggs side by side in rivalry with bungalows, Mr. Mountford and Mr. Hare in opposition with the wide frontages of rival town halls, and Mr. Aston Webb and Mr. Ernest George vieing with each other in something very sweet and tasty. B. C.

**Building for
the Nation.**

THE Government has taken another step in regard to the new public offices—it has selected the architects who are to give form to, and clothe Sir John Taylor's schemes of internal arrangement of the new War Offices to be built on the Carrington-house site in Whitehall and the combined offices to be built on the Parliament Street site. The selections have very generally been accepted as happy and appropriate; the London daily Press without exception has given Mr. Young and Mr. Brydon hearty hand-shakes, and has delivered itself of the fervent hope that their selection will culminate in buildings which shall at once further revive the fading glories of Architecture, and be a joy for ever to the multitudes who love their London, and who have æsthetic perception enough to care for the beautification and glorification of its great thoroughfares. The whole nation—that is the whole part of the small section of the nation which really cares one whit about the subject—will re-echo this wish, and the Profession in particular will take it up with an ardour borne of a wearying desire for some distinctive Architecture which shall serve in some measure to mark the later Victorian Era. Members of the Profession are by no means universally agreed, however, that the selection of the men in whose hands the making of this Architecture now rests, is the wisest. Against Mr. Brydon and Mr. Young other names are quoted; but surely it would be an unparalleled example of the uniformity of men's minds if this were not so. Had we asked our readers to speculate on the probable chances of success of a dozen or so architects for this Government appointment, we do not think Messrs. Young and Brydon would have been hot favourites, yet so far from quarrelling with their selection, we commend it heartily. The Government, we believe, has given much thought to the matter; it wisely sought the best professional advice obtainable—that of the Royal Institute of British Architects—and the committee of the Cabinet who had the question in hand considered at great length the special qualifications of each of the eight candidates for the particular work required—buildings classical in character and design, and built exclusively of Portland stone. In this regard both Mr. Brydon and Mr. Young are capable of good work, and the disadvantages underlying the fact that they are not well known to the London public are, as the Times remarks, questionable. Mr. Young's work at Glasgow, and his completion of Lord Wemyss's beautiful house at Gosford, near Edinburgh, have been greatly admired; but even amid the chorus of praise the voice of the detractor is raised. But then we must remember there are captious critics in every path of life. Mr. Brydon has just erected some notable municipal buildings at Bath, and he has a high reputation for originality and knowledge. So much for the architects. By the end of the year, or very soon afterwards, the sites—two of the most costly in London—ought to be cleared, and the architects be in readiness to commence the work. Let us hope that within a few years London will be enriched by two notably good public buildings.

H. C.

A NEW Congregational school-church has been opened at Preston.

The foundation-stone has been laid of a memorial school at Marykirk, Dundee.

The Berlin City Council has decided to construct an underground railway after the fashion of the one at Buda-Pesth, the London system being unanimously declined.

THE TEMPLES OF PHILÆ.

ABOUT five years ago, writes Lieut.-Col. G. T. Plunkett in the London Review, a thrill of indignation ran through the civilised world when it was announced that, in order to form a great storage reservoir on the Nile for irrigation purposes, it was proposed to submerge the celebrated island of Philæ, with its unique collection of temples and archaeological treasures. The result of an angry protest from lovers of Art and antiquity, and from scholars of every civilised nation, was that the plans were altered, and it was announced that two reservoirs would be made in place of one, and that the dam at Philæ would be made lower than originally schemed, so that the water could never reach the surface of the island. It appears, however, that the water, according to the plans now approved, will still be high enough

TO DESTROY THE TEMPLES

in a few years. Dr. Borchardt has shown, in a paper read by him before the Royal Prussian Academy on April 28th, 1898, that where Egyptian buildings are surrounded with the debris of human dwellings, if moisture is allowed to percolate to them, it dissolves the salts out of the rubbish, and carries them into the sandstone which it percolates; on drying again, the salts, in crystallising, crumble away the face of the stone, and rapid disintegration is caused, as has been seen in the ruins of Thebes and at other places. Dr. Borchardt seems to establish beyond question the fact that the top of the dam must be kept six metres lower than is at present proposed, or the work of destruction will only be postponed for a few years.

THE ORIGINAL PLAN

would have overwhelmed the island with the Nile waters, and the group of temples in their setting of palm trees, which have for centuries enchanted every traveller who has passed the First Cataract, would have disappeared from view for ever. How shall we have gained if, instead of this dramatic close to their history, they are to be sapped year by year at their foundations by water impregnated with the offal through which it percolates, until these glorious monuments become a heap of unsightly ruins? It cannot be pretended that no alternative plan is feasible. The whole Nile Valley, from the junction of the two great streams at Khartoum to the sea, will soon be under Egyptian control; from the Atbara it is so already, and it can only be at the most

A QUESTION OF MAKING THREE

instead of two reservoirs to store an equal quantity of water for purposes of irrigation. If the expense would be somewhat greater, we may set against this the large sums of money spent in Egypt annually by travellers who prolong their stay in the country, and journey to Aswan in order to visit a spot on which Nature and Art have lavished gifts that make it attractive to every sightseer, whilst to the archaeologist it is as sacred as the Parthenon or the Colosseum. As the voice of civilised Europe has already once prevailed, so that instead of one vast lake it has been decided to make two of less depth, it is to be hoped that it will be heard again with no uncertain sound, and insist on such further modifications as will ensure against destruction by the works of man of these supremely interesting relics, which time itself has so long spared, and the forces of Nature alone will not destroy for countless centuries to come.

THE LEIGHTON HOUSE.

IT will be a sad and strange experience for many Londoners when they pass into "The Leighton House," as it is now called, to miss the kindly host who did the honours of it so well, and the stream of guests he used to welcome so cordially on those Sunday-at-Homes in the early months of the year while his Academy works were being planned and carried through with such loving completeness. The house itself, says the Daily News, was for its owner as much a study and a labour of love as any of the works conceived and slowly built up under its roof. As you pass into the inner hall the bronzed cast of Mr. Brock's fine portrait bust is the first personal relic which meets the vision. It stands where the painter so often stood to meet his friends, and at its base is a wreath of bay leaves, the Daphne which he loved so to introduce into his picture, and which he drew with such finesse and accomplishment. To the left of you is

THE ARAB HALL,

of which Leighton was so fond and proud. As you left the studio above he would always beg of you to pass into it on your way to the hall. He and his friend, Mr. Purdon Clark, were one autumn travelling in the East, and arrived at some town where a mosque had just been pulled down, and all its appurtenances, including its tiles, were being dispersed. The chance was a great one for an artist, and especially for an artist who was also a colourist. Leighton bought largely—the carriage home was more trouble than the actual purchase—and the Arab Hall was the outcome of that special journey to the East. Across the darkened vestibule you see the domed hall, with its studied and effective lighting, its cool splashing fountain, its windows jewelled

WITH OLD DAMASCUS GLASS,

its Cairene woodwork, old too, and of exceptional beauty, and its tiles of rich and passionate colour. The Moorish capitals of the columns were carved in polished marble by his friend Boehm; the frieze that runs between them was designed by Walter Crane; the Arabic characters in the architrave over the approach were once the salutation that met the worshipper as he entered the old mosque. It is a building to study and to linger in, and perhaps its great triumph as a piece of design and Architecture is that it impresses you less in detail than in its harmonious completeness. As the Arab Hall was an adjunct to the house, so, but a few years before its owner's death, the top light or

GLASS STUDIO

became for the painter a necessity. In this room, which was a work room, and not always opened on his "At Home" days, are now shown some of the most interesting studies in the whole collection. These are copies which young Leighton made from Memmi's frescoes in the Spanish Chapel of Ste. Marie Novella, when he was staying at Florence in 1853. Here we may see Taddeo Gaddi in white and gold cap, Giotto, gold and sea green, Cimabue, gold flowers on white ground. The criticism on these copies in the admirably written preface to the catalogue should be read carefully. It may be said generally of the drawings here exhibited that with those who only knew Leighton from his finished works, they will increase an already splendid reputation; for even the slightest of these works exhibits that incommunicable gift of style which is the hallmark of genius and only belongs to the great artist of all schools and all periods.

HAMPTON COURT.*

THE ROYAL GALLERY ILLUSTRATED.

BY ERNEST LAW, B.A.

VISITORS to Hampton Court Palace must be well acquainted with Mr. Law's name, inasmuch as the popular catalogue and guide sold at the bookstalls is from his pen, being an abstract of his larger books, "A History of Hampton Court," and "A Historical Catalogue of the Pictures in Hampton Court Palace," published in 1881. The book which we notice to-day is a new edition of the latter.

This new edition, which is much altered and augmented, is a very complete and careful catalogue of the Royal Gallery at Hampton Court, with many critical and historical notes, and also contains excellent reproductions of a number of pictures which are of special interest for one reason and another. It is a misfortune that in a work of this sort equal attention has to be paid to every picture in the collection, for while there are some masterpieces to be seen there, and many paintings which are interesting for one reason and another, the bulk of the contents of the gallery consists of works of the later Dutch schools and of copies, or pictures of very doubtful authenticity, which are neither the one nor the other. And in most cases the backgrounds are very dark,

* "The Royal Gallery of Hampton Court (illustrated), being an historical catalogue of the pictures in the Queen's collection at that Palace, with descriptive, biographical, and critical notes, revised, enlarged, and illustrated with a hundred plates." By Ernest Law, B.A. London: G. Bell and Sons, 1898.

and, therefore, the pictures do not decorate the rooms in the way in which even inferior works conceived from a decorative standpoint would do, giving a general impression of richness and disposing the judgment to view leniently any shortcomings in manipulation. At Hampton Court the effect is sombre and not rich, and the pictures have, therefore, to stand entirely on their own merits. Some of them, uninteresting in themselves, appeal to the collector's feeling by their rarity, but the ordinary educated spectator will often feel that it is a pity that they are not rarer still—yet the labour of searching for details about these is just as great as that about others much better worth notice, and one is disposed to condole with the author on the immense amount of uninteresting labour through which he must have gone to produce so complete and interesting a catalogue.

Among the Italian pictures, especially, are many of very doubtful origin. For instance, Giacompo Bassano is credited with twenty, of which no less than eleven are doubtful, though this is the worst case. As might be expected from the time at which the collection was formed, the larger number of pictures, of whatever school, is very late in date, and shows the taste of the period to disadvantage.

Mr. Law writes with the enthusiasm of a man who has devoted great care and much time to his subject, but most connoisseurs would agree that the fine pictures are like a few grains of wheat among handfuls of chaff, though a gallery which contains Andrea Mantegna's magnificent "Triumph of Julius Caesar," deplorably repainted and damaged though it is, is worthy of many visits. The attention of the visitor should be particularly directed to the early historical pictures, such as "The Meeting of Henry VIII. and Maximilian I." No. 331, "The Embarkation of Henry VIII. from Dover on his way to the

Field of the Cloth of Gold," and "The Meeting of Henry VIII. and Francis I." there, Nos. 337 and 342; and No. 339, "The Battle of the Spurs," which are full of most interesting details of costume, of shipping, arms, and armour. They have, of course, been ascribed to Holbein, but without consideration, the ancient catalogues attaching no name to them, and are probably contemporary works of journeyman painters attached to the Court. The strength of the collection lies in portraits, or in ideal pictures of the nature of portraits, heads and single figures, or half-lengths. Many of these are Italian, a few German or Dutch, and a considerable number, not the best, English. It is curious that there is no example of either Reynolds or Romney.

Mr. Law's book is rather large for a guide-book, but one might do worse than take it with one through the rooms—though the places of some of the pictures have been changed since it's passing through the press. It commences with an historical introduction, a sort of *resumé* of the fortunes of the gallery and of the artists whose works have gone to the making of it. There is a plan of the State apartments, and the rooms are treated seriatim, a description of the fabric preceding the list of the pictures and the historical and descriptive notes upon them in each case, and this part of the book is not the least interesting, as Mr. Law's eye has seen the things of all sorts worthy of notice, and his pen gives details about the construction and decoration of the rooms and the men who had to do with them. The production of the work has evidently been a labour of love—State papers and inventories have been searched for mention of pictures contained in the gallery—the books of the older critics have been studied as well as those of more recent date for any light which might be thrown upon the authorship of pictures or the personality of the subjects of portraits, and the opinions of experts have also been obtained. Copious indices accompany the text, whereby one may find with ease the works of painters, the persons painted by them, and the numbers of the pictures in the Royal inventory coupled with those of the present catalogue. An immensity of labour has been gone through, and the author may be congratulated on its successful issue. In the next edition it would be well to correct the little slip whereby the description of No. 939 remains the same as in the edition of 1881: "This picture has been recently restored and hung up within the last three months!" S. S. G.

Leaves from an Artist's Sketch Book.

BY EDWIN DOLBY.

RAILWAYS, improvements in building, drainage, etc., have made such changes in the character of the old towns of Europe of late years, that very little of the "picturesque" is left, and what there is will soon disappear. That enormous improvements have been made cannot be denied, and it is useless to indulge in sentimental regrets over the inevitable. At the same time much that was beautiful has vanished, and in many cases has been recklessly destroyed. To rescue some fragments of what once existed has been the object of the artist in presenting these sketches to the reader. Meanwhile those who wish to see any of the old cities as they formerly appeared must make haste. Old Rome is nearly gone; Venice is in a state of transition, and very shortly scarcely a vestige will be left anywhere for the sketch-book of the artist, or the speculations of the antiquary.

[Two of Mr. Dolby's drawings, which form part of a collection, are given in our inset pages to-day.—Ed. B.J.]

BRONDESURY, having decided to enlarge its fine parish church, Christ Church, the foundation stone of a new south transept and south aisle, which will be erected at a cost of £3000 from the designs of Mr. C. R. Baker King, was laid a few days ago by the Bishop of London.

CHARLES I. BY VANDYCK.

(Re-published from Law's "The Royal Gallery of Hampton Court.")

ARCHÆOLOGISTS AFIELD.

IN PETERBOROUGH AND DISTRICT.

THE British Archæological Congress was concluded last week. Peterborough and the neighbourhood was the *locale* this year. The first day afield was at Barnack, a distance from Peterborough of six or seven miles. Barnack Church absorbed attention. Its extreme interest from an architectural point of view lies in the wonderful example it gives of five distinct periods of Gothic Architecture, the Saxon, Norman, Early English, Decorative, and Perpendicular. It is interesting to note how natural is the transition from one stage to the other. There is no sharp line of demarcation—it is just a process of evolution and transition. The square tower is Saxon, but the octagonal spire is an Early English addition. The late vicar, when pulling down the ancient masonry with which the Early English spire designer blocked up the west arch, discovered that the foundations were laid on *débris* believed to have been caused by the

BURNING OF THE OLD SAXON CHURCH

by Sweyn—a fact recorded by Ingulphus in 1013. There is some little doubt as to the builder of this church. The most generally accepted version is that Wilfrith, an Archbishop or Bishop of York, was responsible for its erection, and this would bring the date out at about 670. Wilfrith's patron was Alfrith, Prince of Northumbria, who was connected with the district. The emblematical carvings on the tower—which are identical with known churches built by Wilfrith—strongly support the theory. SS. Peter, John the Evangelist, and John the Baptist, are the saints to

whom he usually dedicated, and these are typified in the sculptures of the cock, the eagle, and the dove. The outside walls of the church are Norman work, as is the arcade on the north side of the nave. There is also a Norman side chapel opening from the choir through

A FINE NORMAN ARCH.

There are traces of a causeway connecting the church with the Manor House close by, which from 1189 to the time of Henry VIII. was in the possession of the Abbots of Peterborough. The south arcade is in the Early English style, while the chancel belongs to the Decorative period. The east window is an almost unique example of crooked canopy work, a similar window existing in the chapel at Merton College, Oxford; and lastly, the Perpendicular style is represented by a chapel dedicated to Our Lady, separated from the choir by an arch, to which special attention was drawn. Up to the cap of the pillars the arch is constructed of Barnack stone, while above the caps the stone is foreign. Canon Syers thinks the explanation is that the quarries at Barnack had given out, which would give the date of the chapel as *temp.* Henry VII. The Congress proceeded from the church to the Manor House, where

RELICS OF A NORMAN HALL

were inspected. Then, after a brief inspection of the rectory and its beautiful gardens, the carriages were again brought round, and Wittering Church was next visited. Wittering is a less pretentious building than Barnack, but apparently as old. The arch of the nave is typically Saxon, strong and rude. From Wittering a move was made to Wansford. There are several remarkable features about the church. It is Saxon, and the tower is exceedingly old. The chancel has disappeared, and the building consists merely of nave and

a north arcade. Above the west end of the nave, abutting on the tower, has been constructed a gallery, very quaint in appearance, which is used for the choir. The drive was continued from Wansford to Castor, with its fine old Norman church. It is cruciform in shape, and dates primarily from the early twelfth century. The finest feature of the Norman work is the tower, which is of the richest possible style of the period. A hundred years later additions were made to the church. In 1220 Castor Church was added to, and some fine examples of Early English Architecture are contained within its walls. The pillars of the southern arcade in the south transept are absolutely the epitome of the finest possibilities of the Early English period. Leaving Castor the party drove to Milton Park, once a seat of the Earls Fitzwilliam, now occupied by Mr. Fitzwilliam. The fine pictures and curiosities in the house were examined with interest. Spalding was the rendezvous on the second day. The first expedition was to the Church of SS. Mary and Nicholas, which, from its known history and the completeness of its plan, is of considerable interest. The present church (leaving later restorations out of the question) was built in 1284, and it had its origin in a dispute between the prior and the parishioners of Spalding. The parishioners, it seems, annoyed the monks at their devotions by ringing the bell of the parish church at "unseasonable hours," so a contract was entered into, the parishioners on their part agreeing to pay £100, and the prior and monks on their part agreeing to build a church on the

SITE OF THE OLD CEMETERY.

And so, in 1284, the present Church of SS. Mary and Nicholas came into existence. Previous to this date there evidently was a chapel on the site, dedicated to St. Nicholas. This is known, and it is corroborated—if corroboration be needed—by the fact that one of the walls of the chancel is out of the square, having evidently been built on the foundations of the more ancient Norman chapel. The church was undoubtedly cruciform originally, with a chancel, transept, and nave. The transept had an east and west aisle, while the nave had a north and south aisle. There still remains a perfect specimen of the rood-loft, which is approached by a flight of circular stairs leading from the nave. The rood-screen dates from 1315, but it has been restored by Sir Gilbert Scott. He has, however, preserved the ancient form admirably, having based his

RESTORATION DESIGNS

upon drawings of the original screen, and the result is a harmonious and interesting whole. The church owes a good deal to one Sir Nicholas Aldwyn, whose insignia—that of a woolstapler—is in evidence, for he was a benefactor to no small extent. The chapel of St. Thomas à Beckett, which stands on the south of the chancel, was erected in 1315. The windows in this chapel have the distinction of being only equalled in Ely Cathedral. Otherwise they are unique. In 1360 the south transept and aisles were erected, the north porch—still standing, a monument in its entirety to his memory—being added, in 1495, by another scion of the Aldwyn family. Much of the shell of the original fabric has been removed in the process of restoration. Galleries once existed all round the church, but these have been mercifully removed.—Several places of historical interest in North Northamptonshire were visited to-day week. A drive was taken to Woodcroft Castle, a distance of seven or eight miles from Peterborough. Woodcroft Castle, which is in possession of Baron de Lussan, is a moated grange, and is celebrated from the fact that Royalists from Stamford retired there in the time of the Commonwealth and held the castle against the Ironsides for several days under the leadership of Sir Michael Hudson, a doctor of high repute at Court.—Maxey Church and Northborough Castle, a mile or two from Maxey, were also visited. The wife of Cromwell is buried in the crypt of the Castle, in which also are many skulls. The church, which almost immediately adjoins, is full of architectural beauty.

MELLIFONT ABBEY: ENTRANCE TO CHAPTER HOUSE.

MELLIFONT ABBEY:

ITS HISTORY AND ARCHITECTURAL REMAINS.*

By ANTHONY SCOTT, M.S.A.

(Cor. Mem. Central Society of Architects,
Belgium).

(Continued from page 413.)

At the crossing of the nave and transepts are elaborately moulded piers, which evidently carried a lantern or a low one-story bell tower. These piers, it will be noticed, are comparatively small in size compared to the usual huge masses of mediæval piers in such positions.

One of the earliest rules of the Cistercian order forbade the erection of lofty towers in connection with Cistercian churches, so that the Mellifont monks probably contented themselves with a low belfry raised over the crossing of the roofs. The churches of the monasteries of Villiers and Aulne, two ancient examples of Abbey churches, exhibit a small belfry or fleche, rising from the junction or crossing of the nave and transept roofs, but neither are built of masonry.

These churches were also branched from the parent house at Clairvaux about the same time as Mellifont. In the north side wall of the sanctuary is a door for which no use can be assigned. In the older examples of abbey churches such a feature is absent, while at Mellifont there are no traces of any apartment or building into which this might have led. It is possible that the sacristy might have occupied this position, although there is little room for such a building because of the near proximity of the uncut natural rock, and

besides, such a position would be most unusual and very inconvenient.

The transeptal aisles were divided into three bays, each forming a small chapel. In conformity to Cistercian usage each had a piscina which, by the ordinal of these monks, was of much greater importance than to other communities. Here were performed the prescribed ablutions, both before and after the more solemn parts of each Mass. The piscinas still to be seen present no remarkable degree of ornament. Of the small recess in which each was placed no complete trace is left. The basin of each is of the usual dished type drained in the centre of each pier.

From the sides of the large piers projecting out towards the nave are the remains of the bases of the rood-screen. This feature, which divided the choir from the nave, also served in Cistercian churches as the division between the stalls of the choir monks or fully professed brethren and those of the lay brethren. Of the rood-loft, which we are told surmounted the rood-screen, no traces are left, neither appear any remains of the small stair leading up to it as we generally find. We may, therefore assume that at Mellifont the rood-screen was only erected to support the crucifix and accompanying statues, and that the lessons, from which the rood-loft has taken the name of Jube, were given from the step beneath it.

Between the easternmost piers at the crossing is yet visible the presbytery step dividing the sanctuary from the choir, near the centre of it is a socket, probably intended for the foot of a centre post, which at certain penitential times screen off the altar from the rest of

MELLIFONT ABBEY: WINDOW IN NORTH WALL OF CHAPTER HOUSE.

* A paper read before the Architectural Association of Ireland.

the church. There is another socket-hole near to this last, for which no use can be assigned, except it may have been for a lectern. In the south wall of the sanctuary is a niche, now with a protective grating in front of it. It contains the elaborately carved remains of the piscina for the high altar. It was executed in Caen stone, and is of remarkably beautiful design and clever workmanship. The dogtooth moulding, in addition to the usual work bestowed on it, is deeply undercut, so that a pencil can be passed underneath the raised leaves. The faint remains of the "founder's tomb" are to be seen in the N.E. angle of the sanctuary. But little of this once beautiful monument now remains.

In the east wall of the sanctuary, at about 4ft. 6in. from the ground, is a moulded sill course, whose profile is remarkable. It presents the outline of the usual sill, but is inverted. Its working and general character would seem to indicate that its reversed condition was unintentional, though how it occurred we cannot ascertain.

A noticeable feature of the construction of the large piers at the crossing is the manner which was adopted for working the small shafts. These shafts were detached, with the stonework of the solid pier hollowed out to receive them, having at intervals bond-stones worked out of the solid. We cannot assign any reason for this method of working the shafts. To our minds it would appear to have been much easier to have worked the shaft out of the solid for the whole height of the pier.

The church evinces, as before noticed, curious and well defined marks of alterations. The piers at the crossing show that the later work was built up against the earliest portions, showing a well defined line of junction. Why these changes were made we cannot tell: perhaps to strengthen the piers, or to keep up with the architectural style of the day. No traces of the west end of the church are to be found. The length of seven bays, said to have been the extent of the nave, would bring the west wall near to where now appear some traces of a foundation. But from its appearance it does not seem to have served as a footing for the west front of the church, and not a sign of the west door or its accompanying features are apparent.

The north door, or, rather, the jambs of it, are still in existence, near the centre of the north transept front. The mouldings of the jambs are of beautiful arrangement, and from their profile may reasonably be adjudged to be of a character of the fourteenth century. A little eastward of this door we see a few steps of a spiral stone stair which, it is assumed, led to the triforium. In the northernmost chapel

of the west transept aisle is a recessed press formed in the thickness of the large pier, which corresponds with the pier containing this stair. The remains of this press, which was, perhaps, made for the reception of the sacred vessels, are greatly decayed, and little architectural treatment is now evident.

Turning to the external appearance of the walls of the church: The buttresses, except those at the angles, are of slight projection. Those at the angles are fairly massive, and are built of rubble masonry, with sandstone quoins. A triple plinth runs round the east end of the church. Each stone is throated underneath. Some of the buttresses have, in addition, a projecting drip course (but which is not throated) immediately above the plinth course. The plinth course and mouldings are in a very fair condition, the stone of which they are composed being of a good weathering nature. The walls of the southern transept are not nearly so well defined as those of the northern; the ruins of later additions and alterations have left them much confused and jumbled together, rendering it merely a matter of conjecture as to the precise form of its original divisions.

We may now leave the church, and, passing along the eastern walk of the cloister, a few paces will bring us to the Chapter House, situated opposite the junction of the northern and eastern walks of the cloister, and nearly adjoining the south transept of the church. This building was long known as St. Bernard's Chapel, presumably only because of its ecclesiastical appearance. The date of this building is a good deal later than that of the building which it adjoins. By reference to the plan, it will be seen that this building was built up against an old wall, so that an external doorway of the earlier building became the door of communication between the Chapter House and the cloister. This doorway was once one of the wonders of Mellifont, according to the enthusiastic description of eye witnesses. Little, if any, of this wonderful work remains. One or two stumps of shafts and their bases still exist, but everything else has vanished. This doorway is said to have been worked out in a kind of marble, and it was enriched with painted decorations in gold and very brilliant colours. A writer in Wright's Louthiana, published in 1775, says that, when he saw it, it was sold, and just about being taken to pieces for removal.

Internally the Chapter House is 30ft. long by 19ft. 6in. wide. The walls are built of the rubble masonry similar to that used in the other buildings, with dressings and moulded stonework of the sandstone we have before mentioned. The Chapter House is groined in

two compartments, with cross and diagonal ribs. The ribs are all elaborately moulded, and each springs from a separate shaft. The treatment of the springing of the ribs is peculiar, and possesses much elegance. The shafts supporting the main ribs are continued to the floor line. Those of the wall ribs stop at a ledge at the level of which was inserted the stone bench where the brethren seated themselves every morning while the chapter of St. Benedict's rule was read. From this circumstance the building received its name of Chapter House.

No part of the tracery of the east window is left; only the bare opening remains, from which all the stone mullions have disappeared. There seems to have been two windows in each of the side walls; two are now built up, that one nearest the east end in the southern wall is much dilapidated, but the opposite window to this is entire and complete, only part of the centre mullion being restored work. The internal splay of these windows are finished on the inside with small shafts, each having carved caps, &c., supporting the moulded curtain arch. The caps to these shafts are delicately carved in various designs, but the bases are curious. They represent grotesque heads, which are carved so as to appear as if squeezed down by the superincumbent weight and pressure of the shafts above them. It will be noticed that the evident reason for such a treatment was the very slight projection of the sill course and the position of the shaft. For here we have the base proper some few inches above the sill, with the shaft continued underneath the base mould till it stops at the sill course.

The tracery in the window which is sufficiently perfect for us to decide on is of a fifteenth century type. The mullions and tracery are very massive and are of very graceful outline, and all delicately moulded. Internally, a carved nail head moulding of beautiful workmanship surrounds the tracery.

A close examination of the walls and mouldings of the Chapter House shows that the plain wall spaces were plastered, and the plaster decorated in bright colours. It is, however, remarkable that no allowance for the thickness of the plaster was made in the wrought stone dressings, consequently the plaster was of extreme thinness, and seems to have encroached on the cut stone work in many places.

The room over the Chapter House is known as the Muniment Room, or rather, that is what the rooms in similar position at other abbeys were called. This room is to be reached only by a risky climb upon the remnants of old walls. We have no information relative to the arrangement of the first floor apartments at Mellifont, and no knowledge of how and from whence it was reached. At present the Muniment Room forms a large roofless chamber with the west wall entirely missing. It has in the north side a fireplace, of which the upper portion and part of the stack are evidently of the original work. The fireplace has signs of subsequent alterations, probably those carried out when Lord Moore's family made their residence at Mellifont.

The inner arch of the east window to this room, of semi-circular shape, is yet existing, but there is no remains of tracery or other work to this or any other of the windows. In the south wall of the Muniment Room is a small press or recess for shelves. The stone front arch is still existing, as also some of the dressings of the jambs. The arch and jambs are chamfered on front arris, the arch also chamfered on the inside face. Within this recess are unmistakable evidences of shelves having been fitted up. Whether these were part of the original finishings or subsequent insertions we cannot now ascertain.

In the thickness of the wall containing the fireplace is a stone stair leading up to a second floor, or out to the roof or battlement. Beyond the fact that there are still to be seen the chases for beam ends or corbels in the walls of the Muniment Room at a height of about 8ft. from the floor; no information as to the finish of the upper portion of the Chapter House buildings can be obtained.

(To be continued.)

MELLIFONT ABBEY.

PLACES OF HISTORIC INTEREST.

WHAT THE NATIONAL TRUST IS DOING.

THE annual general meeting of the National Trust for Places of Historic Interest or Natural Beauty was held in London last week. The president, the Duke of Westminster, presided. The annual report stated that during the past year there had been a steady growth of membership. As the aims and objects of the Trust became better known, it was more and more referred to for help and advice in the protection and preservation of places of historic interest or natural beauty. The acquisitions of the past year had been two, each representing a different class of property. The members of the Trust had long been anxious that it should secure one of

THE HEADLANDS OF KENT

or Surrey overlooking the Weald, and commanding a view of the hills, as these promontories were being rapidly purchased for

through. The sale of the Marquis of Worcester's Monmouthshire estate might possibly provide the Society with the opportunity of acquiring Tintern Abbey, a piece of property of national interest. The Society hoped, as soon as the necessary arrangements could be made for their transfer, to become the trustees of the site of Driffield Castle and an old Columbarium at Garway, near Ross. The report also referred to the action taken by the Society to prevent injury and destruction, especially in regard to the St. John's Improvement and

VICTORIA EMBANKMENT EXTENSION BILL, the ancient camp at Uphall, near Ilford, in Essex, the Clava stones on the banks of the Nairn, Church Row, Hampstead, the old inn at Maiden Newton, the old vicarage at Luton, Christ's Hospital, the Monk's barn, Peterborough, and several railway projects. The statement of accounts showed a balance in hand of £191 on an income of £1177.—The President, in moving the adoption of the report and accounts, read a letter from the Princess Louise regretting her inability to be present and expressing entire sympathy with the

part of the playgrounds of London.—Canon Rawnsley, the honorary secretary, seconded the resolution, and mentioned that the Trust had taken action in opposition to the extension of the Great Western Railway from Henley to Great Marlow. Opposition had been also decided upon in the case of the proposed Lynmouth and Minehead light railway scheme, and the light railway projected to pass through the pass at Aberglaslyn. He also pointed out that

THE MONUMENT TO CAEDMON,

the first English Christian poet, would be opened at Whitby by the beginning of September.—Sir Wilfrid Lawson, Sir John Hibbert, and Dr. Longstaff supported the resolution, which was carried unanimously.—The Earl of Crewe, in moving the re-election of council, said that the work of the Society was of general and national concern. He thought, however, its energies at present would best be confined to preserving the smaller national monuments, since they were in the greatest danger of destruction. There was very little risk of the destruction of large historical monuments like Tintern Abbey.—The Bishop of Bristol seconded the resolution, which was adopted.

HEAD OF A BISHOP.

HEAD OF A BISHOP.

ANCIENT STATUES FORMERLY ON THE SPIRE OF ST. MARY'S CHURCH, OXFORD.

building, and enclosed. During the past year that wish had been in a measure fulfilled, Mr. and Mrs. Richardson Evans and their relatives having presented to the Trust, in memory of Mr. Frederick Feeney, some land on the spur of Toy's Hill, which afforded an uninterrupted view to the South Downs. This was the first realisation of the idea suggested by the Trust that memorials should sometimes take the form of beautiful scenery or of land commanding beautiful views dedicated to the memory of the dead. The adjoining piece of land on the spur had been presented to the trust by Miss Octavia Hill. The Trust had also acquired

JOINER'S HALL, SALISBURY, an interesting old building, the impending destruction of which had too often led only to protests and vague regrets. The work of repairing the old Clergy House at Alfriston was now nearly complete. A memorial stone had been erected at Barras Head recording its purchase by the Trust and its dedication to the public. With regard to Barmouth cliff, the Council regretted that the negotiations with regard to the addition of certain land to that already possessed by the Trust had fallen

"good and useful work" the Society is doing. He trusted that as the Society became more known it would be more liberally supported. It was a matter for congratulation that two acquisitions had been made during the year to the property of the Trust, and that the old Clergy-house at Alfriston was now repaired and open to the public. Large properties belonging to the Duke of Beaufort would shortly come into the market, among them Tintern Abbey, and the Council were now in communication with the Marquis of Worcester's solicitors with a view of ascertaining whether it was possible for the abbey to be sold to the Trust. Unfortunately, it was not possible for the Trust to be always successful in its action. It had been unable to prevent the melancholy destruction of the Falls of Foyers. He could not understand how it was that more local interest had not been taken in the preservation of these falls, the spoilation of which he considered the most discreditable achievement of the time. With regard to the Hampstead Heath extension scheme he hoped that the project would shortly be brought to a successful completion, and a very considerable addition made to the amenities of that most desirable

STATUES AT OXFORD.

THE illustrations on this page show two of the magnificent series of ancient statues once adorning the spire of St. Mary's Church, Oxford. In common with their fellows, they are, despite their centuries, in a remarkable state of preservation. The stone has weathered to a surface of great hardness; with care and skill these might have been retained in their ancient position on the tower, whereas they now rest in a dimly-lighted basement room at the back of the church. The illustrated article on the work done to the tower now appearing in the ARCHITECTURAL REVIEW will be of interest to all who know Oxford and deplore the loss of her most striking monument.

IN the notice of the Manchester Building Trades Exhibition, which appeared in our last issue, the firm of Walter J. Pearce was referred to as Walter T. Pearce. As there is more than one firm of that name engaged as artists and craftsmen in glass, we desire to make it clear that the work we illustrated was by Walter J. Pearce, of 12 and 14, Albert Street, Manchester.

A FAMOUS WARWICKSHIRE CHURCH.

GREAT SCHEME OF RESTORATION.

AT a famous Warwickshire church—the Church of St. Mary, Warwick—a great work of restoration has recently been carried out. The work has been going on for fifteen years, but no detail of the history that remained writ in its walls, and set forth in its monuments, has been effaced. Standing now almost exactly as it did 200 years ago, the fabric tells a story which has all the interest of fidelity, though some of its chapters may not altogether please the lover of purity in Architecture. The first chapter, says a correspondent in the Birmingham Post, is to be read in the crypt—all that remains of

THE OLD NORMAN COLLEGIATE CHURCH founded on the site of an ancient Saxon edifice, and possibly of an earlier British church, by Roger de Newburgh, son of the first Earl of Warwick, about 1123. Here the marvellously well-preserved vaulting, the massive piers, and the characteristic toothed mouldings tell their tale tersely, but eloquently, as far as it goes. The eastern portion of the church, viewed externally or internally, presents a more richly illustrated, though not quite complete portion of the story. Piled in picturesque irregularity, the chancel or choir, the Beauchamp Chapel on the south side, the Chapel of St. Anne, the staircase turret and the little semi-hexagonal chapter-house on the north, and the clerestory

WITH ITS FLYING BUTTRESSES,

form a poem, the harmony of which all but quenches the one note of discord thrown in by later builders. The rich panellings and tracery of the early perpendicular period tell of the taste and piety of yet another family who held the earldom of Warwick. Thomas de Beauchamp, one of the heroes of Crecy, who died in 1394, and whose effigy, with that of his wife, reposes on a high tomb in the middle of this part of the church, was the founder of the choir. The Architecture, however, shows that the work was completed, if not begun, by his son and successor, Richard de Beauchamp. The latter is the Beauchamp who built for himself and his family the beautiful mortuary chapel on the south, one of the architectural gems of Warwickshire. The east window of the choir is of six lights, divided by a transom and filled with modern-painted glass in memory of the Rev. John Boudier, vicar from 1815 to 1872, and representing scenes in the life of the Saviour. At each side the choir is lighted by

FOUR FOUR-CENTRE ARCHED WINDOWS

of four lights, continued downwards in blank panel work. The roof is groined in four bays, the octagonal panel in each bearing a shield with the arms of the Beauchamps. Flying ribs springing from the spaces between the windows help to support the roof, and make a graceful finish to the design. The sedilia piscina and the richly-carved ground recess to the north side, supposed to have served as a holy sepulchre in Passion Week, with other ancient and interesting features, remain. The reredos, a fine piece of work, though scarcely in harmony with the rest of the choir, represents the Adoration of the Magi. It was given in 1886 in memory of Mr. Margetts, a well-known citizen of Warwick, and forms one of the few features of the recent restoration which affect the chancel.

THE BEAUCHAMP CHAPEL,

commenced in 1443 and finished in 1464, with the elaborate tombs of its founder, of Ambrose, the good Earl of Warwick, of the famous Robert Dudley, Earl of Leicester, and his third wife, of "the noble impe" his son, and of various connections of the Beauchamps; its delicately grained roof, its sculpture of various kinds, its niches despoiled centuries ago of their golden images, its deeply interesting chantry chapel, and its wealth of architectural and historical associations, must be passed over. Coming back to older portions of the

church more closely touching the building as a place of worship. Of these among the older portions should not be left unnoticed the ancient chapel on the north side of the choir now used as a vestry. The minister's portion, divided from the rest by a stone screen, believed to date from the fifteenth century, has in its windows some very interesting fragments of the early stained-glass from the east window of the choir, and of some later glass, apparently of Flemish origin. From the outer part of the vestry the little chapter-house, disfigured since 1868 by the incongruous monument of Falke Greville, the first Lord Brooke, but otherwise requiring little else than cleaning to make it seemly. There is not much else to complete the enumeration of the ancient parts of the church still remaining. The same Richard de Beauchamp who built the choir and the chapel rebuilt the nave and aisles. A drawing made towards the end of the seventeenth century, and attributed by some to Sir Christopher Wren, shows a harmonious Gothic church except that a lead roof, steeper than is customary with lead, though, as now, dropping in a curve from the more lofty eastern gable, had taken the place of the high-pitched roof of tiles which no doubt formed part of the original structure of De Beauchamp. At the west end was a Norman tower standing within the boundary line of the nave, while over a porch on the south was a chamber known as the library of Rous, who was chantry priest of Guy's Cliff, in the fifteenth century, and one of Warwickshire's famous antiquaries. Such was the church which might have remained to the present day, to afford to the restorers a more grateful task in some respects than that which they have had to perform. But on September 5th, 1694, a great fire broke out in Warwick, and many of the inhabitants removed their goods to the church for safety, as they thought only, however, to furnish fuel for the destruction of

A LARGE PART OF THE CHURCH

itself. The tower, nave, and transepts were completely gutted, and had to be pulled down. The fire-marks on the northern walls of the transepts still remain to call forth gratitude that a loss even still greater was escaped. Many would say, no doubt, that the rebuilding was a greater loss than the fire. It was the era of Wren, and the devotion of Wren's disciples often outran their judgment. It is to one of these disciples, Sir William Wilson, then carrying on the business of a builder at Sutton Coldfield, that we owe the present incongruous effect. A new nave was built, having four windows on each side, each window containing six principal semi-circular headed lights, three above and three below, divided by reeded shafts or mullions, an attempt at tracery being made on the head of each window by filling it with a large light and two smaller lights of the much derided "horse collar" form.

THE TRANSEPTS

—which were slightly extended—were similarly treated. In the spaces between the windows were placed buttresses in stages, but of meagre design and slight projection. No clerestory was provided, but, a "railing" being then considered an indispensable architectural feature, the builder placed a horizontal cornice along the wall, a little above the windows, and over this an open balustrade parapet, with heathenish stone urns at intervals. Not satisfied with so adorning his own mantelpiece, so to speak, Sir William Wilson carried his railing and his knobs along the clerestory of the old choir. The new tower, it is said, was carried up 90ft. on the old site when it collapsed. The piers supporting the inner western arch of the nave are very massive, and appear to have been intended originally to support a tower. The site, however, was changed, the two western piers of the tower being used to support the east side, and two more being built outside the church, so that the supports of the tower now form four arcades open to the street.

THE TOWER,

in spite of its Architecture, is imposing on account of its height—to the top of the battle-

ments 130ft., and to the top of the pinnacles 174ft. When viewed as a whole the church and tower form an impressive ensemble. It is generally admitted that the architects of Wren's school, weak as they were in regard to detail, realised the importance of breadth and dignity in general design. Internally the nave was divided from the aisles and transepts by four arches on each side, pointed in form, and supported by piers of design suggesting the fifteenth century, the moulding capitals being composed of the echinus and acanthus. The roof was arched and ceiled, and each bay was divided into eight compartments by small plaster ribs, so as to resemble groining. During the Queen Anne and Georgian periods galleries were placed over the north and south aisles and at the west end. To the latter the organ, which formerly stood over the chancel arch was subsequently removed.

THE GALLERIES,

as such, left little to complain of, and the west gallery and organ front were finely carved, the principal feature being a trophy of musical instruments. The present period of restoration commenced in 1884 with the tower, which was taken in hand by Mr. Butterfield about fifteen years ago. In this case, as in others, the repairs were rendered necessary by the crumbling of the soft Warwickshire stone. The tower was taken down to below the battlements and rebuilt exactly to Wilson's design, while the fancy was renewed where necessary. The artistic scaffolding of the tower at the time was the subject of much admiration, and a lady living in the neighbourhood was led by noticing it to give £2000 to complete the work of repair, while the building of the tower in Queen Anne's reign cost £4782. The recent repair of the tower cost £6000. In 1891 Mr. J. A. Chatwin, of Birmingham, succeeded Mr. Butterfield as the architect. It was then proposed to take down the galleries and rearrange the seating in the church. It was also found that the vaults under the flooring of the church were in an insanitary condition, and, therefore, a foot of concrete was put over the whole area. On taking down the galleries it was found that most of the timbers let into the walls were rotten, so that if the galleries had been retained they would have had to be rebuilt.

THE FLOORS

have been relaid with wood blocks, and the passages with York stone, and Portland stone slabs placed diamond fashion, giving a chequered effect of grey and white. The organ, built in 1717 by T. Swarbeck, used to rank among the finest and largest in the kingdom, but its mechanism was past repair. The church is now provided with a Hope Jones electric organ, similar to that in Worcester Cathedral. The ugly old pews have been removed, and a few oak benches, serving now as the Corporation seats, have been placed in the nave, to show how it is desired to replace throughout the church the chairs at present in use. The church is lighted with gas by means of very handsome pendants, by Thomason, of Birmingham. The recent building work, which has been done by Messrs. Smith and Son, of Milverton, includes the almost complete renewal of the tracery, such as it is, of the windows on the south side, which has suffered most severely from the weather, and such other repairs as examination has shown to be necessary. The organ, when completed, will have cost £2300, part of the scheme being to put a 32ft. pedal stop at the west end. Oak seats and desks for the clergy, and new choir stalls are desired, the present chancel seats being out of keeping with this, the finest part of the church. During the fifteen years, about £15,000 has been spent, and the additional cost of the estimated work is £5000. From the point of view of the visitor, the change has made it clear that ecclesiastical Architecture of the style of the later portion of the church is decidedly more impressive from the interior than from the exterior if the architect's design be given fair play. Though the loss of its Georgian snugness may be regretted for a time, St. Mary's, as becomes a church that was once collegiate, has now a cathedral-like aspect within as well as without.

TWYFORDS.

A CHAPTER IN THE HISTORY OF POTTERY.

THESE are the days of trade catalogues. Almost every firm of note issues, with regularity, voluminous budgets of its specialities. These bulky volumes attain varying standard of excellence, but until recent years the standard was for the most part depressingly indifferent. The trade handbooks of the lower order were not suffered long to endure the light of day, but were speedily swallowed up by the rapacity of that beautiful institution—the waste paper basket.

The press of competition to-day, however, is evolving something new. It is found that in trade catalogues a respectable mediocrity will not do. This discovery has led to the issue of volumes which would delight the heart of even the most venerable æsthetic. The trade expert, the artist, the printer, the lithographer, and the bookbinder have combined to alter the old order of things. One or two notable editions of recent date amply illustrate the point. But the advance on the Art side seems now to be extending to the literary; the trade catalogue, in fact, seems to be passing beyond the frontier of conventionality into a more literary clime. In the foremost van of the new movement are Twyford's Limited. Under their auspices has just been issued a most comprehensive "Chapter in the History of Pottery," by Joseph Hatton.

The author speaks of the antiquity, the beauty, the utility of the potters' art, ably and eloquently telling his story, which covers the romance of Bradwell and Burslem, and shows how early the name of Twyford became associated with pottery—how in the last quarter of the seventeenth century Josiah

tion of assuming a virtue though he might have it not, but of sustaining the disguise of a shrewd intelligence under the aspect of a doltish stupidity. The Elers took him on, and he successfully played his part of an indifferent toiler who was content with his humble wage and position." Astbury, through similar cunning, met with equal success. Josiah Twyford afterwards established his works at Shelton, and the family has continued potting in the district

A TWYFORD TEA-POT, 1686.

(From "Twyfords: A Chapter in the History of Pottery.")

with probably the lapse of a generation until the present time. Prior to fifty years ago Twyford's made general pottery. Since then they have confined themselves to sanitary and plumbers' ware, and with what success we know. It is to the enterprise and ingenuity of these pioneers that the world owes the embodiment, in earthenware, of our soundest sanitary

he made bricks, and stamped them with the names and titles of the monarchs, for whom they were manufactured. The wheel, upon which his earliest designs of beauty and usefulness grew under his formative hand, was the wheel of the Ancient Egyptians, as it is in the present year of Grace the familiar implement of Staffordshire. The antiquity of the Art is emphasised by Homer, and the Art itself is the motive of some of the most expressive similes of the Holy Writ, now better understood of the people than that in which it is said of the Creator that 'Nations are in his hand as clay in the hand of the potter.' It contributes to the household service of the humblest cottage, and adorns the palace of the king. With the smallest coin of the realm the peasant may supply himself with such ware as he may need, while he who has a taste for Art in its most æsthetic form may indulge it in pots that are worth far more than their weight in gold. No less the standard of the world's social and commercial progress, pottery has provided the only existing record of the past; it may be said to have been the papyrus and stencil of pre-historic peoples. The Assyrians and Babylonians perpetuated their earliest writings in clay. Their cylinders, hexagonal prisms, and other forms of Ceramic Art were constructed for the purposes of legal and historical chronicles. In this fashion an account of the campaign of Sennacherib against Judea and the tributes of Hezekiah is preserved for all time. The ancient Greeks and Romans perpetuated the history of their manners, arts, and customs, in relics of the potter's wheel and lathe; and in that far-distant future of the New Zealander's investigation of the ruined arches of London Bridge he may decipher the landmarks of British story in the remains of the potting of one time, just as we to-day read the history of the occupation by the Romans in their bricks and

ASTBURY OR TWYFORD WARE IN THE JERMYN STREET MUSEUM.

(From "Twyfords: A Chapter in the History of Pottery.")

Twyford and John Astbury, by their cunning and artifice, overcame the strategy of the Brothers Elers, two potters of Amsterdam, who attained great success in pottery with the beautiful red clay found at Bradwell in the vicinity of Burslem, and who zealously kept their manufacturing secrets until learnt by the two local potters. Twyford and Astbury applied for employment at the works, knowing that the Elers selected their servants and labourers from the dullest and most stupid people they could find. Twyford met with early success. "He relied upon a carelessness and indifference of manner that went without a challenge. It was not a ques-

principles—and not only so, but the establishment of these very principles. Thus Twyford's have nurtured sanitary science as applied to pottery from its infancy. They are undoubtedly pioneers; they have ever been in the forefront in improving lavatory basins and the like, into the details of which we need not enter here.

We are tempted to quote Mr. Hatton's opening passage: "The potter was the first artist. He was also the pioneer of the world's great industries. His creative instinct found its earliest expression in clay. Before the myth of Prometheus and the stolen fire he made his pot and baked it in the sun. His earthenware is contemporary with the pyramids. He preceded Tubal Cain and the artificers in iron and brass. Two thousand years before the Christian Era

vases and the relics of their tombs and wash houses."

The concluding part of Mr. Hatton's "Chapter" deals with the manufacture of sanitary pottery, completing a very delectable review of the oldest and one of the most interesting of the Arts, with special reference to a firm most honourably associated with that Art. "A Chapter in the History of Pottery" would, we think, have gained considerably in artistic merit had the decorative side of the subject received more adequate treatment in illustration. As it is, a few early examples of pottery alone stand in relief to the many whole-page illustrations, which, while they show how, and in what manner of place, pottery is produced, do not in themselves embody the soul of Art. H.C.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

July 27th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slat; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

CONTRACTS have been entered into by the Government for the erection of three powerful forts on the cliffs at Dover—one between Dover and St. Margaret's Bay and two near the Western Heights. The forts, which are for the protection of the national harbour, are to be completed under very heavy penalties in

England. The original edifice was built in 1677 by the help of Charles II., the Duke of York, and Bishop Compton. In 1682 the Greeks were turned out of the church by the vestry of St. Martin's, and it passed into the hands of the Huguenots, who remained in possession until 1822, when a body of Nonconformists took it over. Twenty-seven years later it seemed destined to degenerate into a low dancing saloon, but Canon Wade, rector of St. Anne's, Soho, came to the rescue and succeeded in purchasing the property for £1500. In recent years the church has belonged to the High Court party, its vicar being the Rev. Robert Gwynne, B.A. It may not be generally known that St. Mary's is the church which figures in Hogarth's picture "Noon," one of the "Four Times of the Day" series. In the "Anecdotal Descriptions" of Messrs. Ireland and Nichols the scene in question "is laid at the door of a French chapel in Hog Lane, a part of the town at that time almost wholly peopled by French refugees or their descendants." An appeal is now being made for funds to restore the nave, the handsome chancel, the foundation stone of which was laid by the late Canon Liddon, is at present exposed somewhat to wind and weather.

CHURCH steeples are generally considered as of little use except for the sensation they cause by occasionally falling down, and for serving as a refuge for bells, which often disturb the repose of the community. It has been left for

the teaching of decorative design may be seen in a commission recently executed by the school for the chapel of the Deaf and Dumb Institute, Prince's Road. This consists of a series of four tablets, upon which are written, in decorative Gothic lettering, the Ten Commandments, the Lord's Prayer, and the Apostles' Creed. The purpose of the tablets being extreme legibility, as opposed to the ornate confusion common to many such adjuncts to the munemonic embellishment of a church, they are, therefore, moderately ornamented, and such purely decorative details as are employed do not interfere with the function of the lettering. A frieze of cherubim at the head of each tablet gives the necessary note of colour, and imparts a unique character to the design.

The prices at the Burne-Jones sale can only be described as marvellous, when we remember that the majority even of the pictures were unfinished or were mere studies. The 5500 guineas given for "Love and the Pilgrim" is the high-water mark of Burne-Jones prices, and altogether something like £24,000 was obtained for ninety lots. How the appreciation of Sir Edward's drawings is increasing among connoisseurs may be seen from the 650 guineas given for "The Dream of Lancelot," and the figures, relatively as large, paid for other pastel studies. The watercolours, of which there were only eighteen, fetched £7000, which was

TWYFORD TEA-POTS IN THE HANLEY MUSEUM.

(From "Twyfords: A Chapter in the History of Pottery.")

eighteen months, and operations have already commenced.

LONG after the time promised, steps are being taken to place the new panels on the front of St. George's Hall, Liverpool, scaffolding being now in course of erection for that purpose. No doubt the unsymmetrical arrangement of the sculpture on the front of the hall has been a puzzle to strangers, but this will be obviated by the fixing of the new panels. In this connection it is gratifying to learn that the group of figures at the south end of the hall are to receive that attention which they so badly need, as for long enough, in consequence of their neglected condition, they have been the subject of complaint. It is understood that the figures are about to undergo a thorough examination by an expert, with a view to ascertaining what requires to be done in order to improve their appearance. Undoubtedly the group is one of the finest of its kind in the country.

ST. MARY THE VIRGIN, Hog Lane—the older part of which the County Council has just demolished on the ground that it was no longer safe—is the most ancient Greek church in London, or, for the matter of that, in all

the village of Long Sutton to find a new municipal use for these miniature "starry-pointing pyramids." The Urban District Council of the place mentioned have a fire-engine and several lengths of hose, but are at a loss for means of drying the latter after they have been washed in preparation for a conflagration, on any scale, that may take place. After due reflection they severally and conjointly evolved the brilliant idea of utilising the steeple of the parish church for that purpose. The proposition that "hose" exhibited on a church might be construed by some as unauthorised ecclesiastical vestments was considered frivolous, and the vicar was accordingly requested to make room for the articles. At first he demurred, finding no precedent for such a use of the church fabric, but after a long correspondence he seems to have conditionally granted assent. He insists, however, that the whole matter must be left to his superintendence, because he repudiates the notion that the Urban District Council have anything to do with church management. Fire-hose hung out for drying purposes can hardly be considered as an ornament to a steeple, but really good effects might be obtained, especially of the sunset kind, if the burnished helmets of the firemen could be added.

A VERY practical result of the attention which the Liverpool School of Art gives to

quite as remarkable as anything in the sale. Burne-Jones was a splendid draughtsman, and, large as were the prices paid for many of his drawings, we cannot think them, on the whole, excessive. That hundreds of guineas should be given for finished studies is, on the whole, less remarkable than that fifty should be paid for small drawings of the most sketchy description.

We cannot venture to suggest, says the St. James's Gazette, what may be the position of Burne-Jones prices twenty years hence; but it seems highly probable that in the immediate future they will exceed even the remarkable results of this sale. It would be difficult to account for such prices, were it not that rich men now regard picture-buying as an investment. And nobody can doubt that, when the purchases are judiciously made, pictures often do provide a better return for the original capital than could have been obtained by investing it in stocks and shares. Moreover, there is no more agreeable way of investing spare cash. You have the pleasure of looking at the pictures—and even an inferior picture is in a higher style of Art than the average share certificate. If a rich man framed and glazed his share certificates and hung them round his walls, his life would be made uncomfortable for him, but happily nobody can be called a vulgar plutocrat for collecting a gallery of fine pictures.

THE London County Council had to face some grave decisions at its last meeting in relation to the direct employment of labour. It is an open secret that there has been much difference of opinion among the Progressives as to whether it is wise to load up the Works Department with the new asylum, which means over a quarter of a million. Therefore tenders were invited; but the lowest contractor proved to be £12,000 above the estimate for which the Works manager was willing to do it, and the Asylums Committee, being in a great hurry to house their ever-increasing army of lunatics, have unanimously agreed to give the big job to Mr. Adams.

ODDLY enough, other heavy works are also falling upon the Works Department. There is £120,000 worth of sewer work which is coming in at once, and there is a block of the Foundry Street dwellings, for which no outside contractor will even tender. And then there is the Greenwich Tunnel, for which Messrs. Mowlem and Messrs. Pearson have tendered, but only naming prices more than fifty per cent. above Sir Alexander Binnie's estimate. The Bridges Committee propose that the engineer should do this himself, but that will never do. We cannot, the Chronicle observes, have two or three Works Departments running side by side. If Mr. Adams cannot undertake the tunnel—and we fancy it is not within his natural scope—then it must go to the contractor; as an excellent object-lesson of the comparative costliness of that method of municipal work.

It is not commonly known that the shell of portions of old Whitehall Palace is preserved within the walls of the range of buildings now occupied by the Treasury, Privy Council, and Education Offices, which will be vacated upon the completion of the proposed new buildings in Parliament Street. For on that site Henry VIII., on gaining possession of Cardinal Wolsey's palace, until when called York Place, erected a cockpit, a tennis court, certain "lodgings," bowling alleys, and a great hall with four angle turrets, along the park side. His additions were separated from what is generally termed Whitehall Palace by the northern part of King Street. Across that street he built two gates—one, by Holbein, named the Cockpit Gate, opposite the present Dover House, and the other, King Street Gate, to the south, at the south-west corner of the Privy Garden, whereof a slip yet remains adjoining Gwydyr House, tenanted by the Charity Commissioners. The cockpit's exact position, which gave rise to some "historic doubts" not long ago, is clearly shown in Newcourt's map, engraved in 1658 by Faithorne, in Fisher's large-scale plan, and in later plans preserved at the Soane Museum. At this day it is covered by the Treasury Chambers, built by Kent in or about 1740, which stand between the First Lord's official residence in Downing Street and the south-east corner of the Horse Guards parade ground—the old tilt-yard, where is mounted the guard still styled for military purposes the "Tilt-yard Guard."

THE Cockpit, too, gave its name to the adjacent lodgings. From his rooms there Philip, fourth Earl of Pembroke, saw Charles I. walking to "the street before Whitehall" for execution of sentence; on February 25th, 1649-50, the Commons resolve that "the Lord Lieutenant of Ireland shall have the use of the lodgings called the Cockpit;" writing to his wife to announce his victory at Dunbar, Cromwell addresses his letter to her at the Cockpit; the lodging was afterwards given to General Monk, who died therein in 1670, and then to George Villiers, Duke of Buckingham. The present Treasury Chambers, in Whitehall, encase the walls of the great hall of the Palace, next to which, southwards, was the tennis court (Privy Council Office), as plotted in Fisher's plan of the Palace surveyed before the Duke of Albemarle's death. A passage between the hall and tennis court gave access from the street to the Cockpit lodgings in the rear. Sir John Soane transformed the hall and tennis court for public offices; a model he made shows that he designed a corresponding

block to stand on the remoter (or south) side of Downing Street, where are now the Home and Local Government Offices, with a triumphal arch between them opening into the Park. There Sir Charles Barry made further changes in Soane's elevation, so that as seen from Whitehall the front retains not one pristine feature to tell us its story.

IN a speech delivered on the occasion of the distribution of prizes to exhibitors at the Salon, M. Jean Paul Laurens was bold enough to attack with some severity the part played by the amateur in the practice of Art. His view seems to be that the effect of the exhibition of amateur work is to lower the standard of the national school and to interfere with the proper development of artistic effort. The question which he opened up is quite as much a burning one in this country as it is in France. Our exhibitions suffer in value and authority from the incursion of quantities of ill-considered productions which are at best simply more or less skilful imitations of the creations of the few great and original artists; and the bulk of these productions owe their existence to the amateur who can copy, but not initiate.

IF public taste were so educated that it could draw the right distinction between the earnest master and the plausible pupil the influence of the amateur might be harmless enough; but as things are the public, always incurably amateur, accepts the imitations, which are sufficiently commonplace to be intelligible to the outsider, and makes no attempt to appreciate the significant statements of the artist who originates. As a consequence there is no chance given to artistic educators to make themselves heard by the people at large, for they are kept, by the irresponsible hangers-on of the Profession, from coming properly in contact with that section of the community which is capable of enlightenment. The amateur has assumed the place of an interpreter of a language whose idioms he most imperfectly understands, and by his interposition the public, which understands less, is led hopelessly astray. For this reason, says the Globe, M. Laurens is certainly justified in his complaint, and we may echo it in this country.

THE Church of St. Clement Danes, Strand has at last been reopened after being closed some months for restoration. The restoration has been carried out at a cost of £5750. The church, which was built from the designs of Sir Christopher Wren, is chiefly remarkable for the profusion of plaster carving in the roof. This, as well as the old oak carving, has been restored, and no effort has been spared to bring out the whole of Wren's beautiful work. The electric light has been introduced, and the church has been re-seated, the old oak pews being utilised. In addition, new choir stalls have been added, and an extension has been made to the massive organ case. The church was attended by Dr. Johnson, when he lived in Bolt Court, and a tablet let into a pillar near a seat in the north gallery which he used to occupy states that it was placed there by parishioners "in remembrance and honour of noble faculties nobly employed."

THE Bishop of London, at the opening ceremony, said it was easy to look back upon the church as being a comparatively modern church, and as being associated with one particular epoch of Architecture, as, no doubt, it was. But it was not a new church when it was built. When the present structure came into existence it was meant to be simply an extension, or a perfecting, of something that had been there before. What that building was they did not know, but an inscription told them that it was gradually decaying in the year 1680, and that the men of that time undertook the rebuilding of it. Its very name told them of its great antiquity. It was placed just outside the walls of London, where, probably, there had been an early settlement of the Danes; and the name of that settlement was absorbed into the name of the church, and had remained ever since. Church after church was built upon the site, one replacing

another, until they got the building in which they then stood. The men who built it knew what they were doing; they took the old church and used such of it as they could. It became a larger, and, perhaps, a more beautiful church than ever it had been before, the services of that great architectural genius, Sir Christopher Wren, having been secured to render it beautiful. And so the present church came into being as a memorial of the faith, the perseverance, and the self-sacrifice of the men of the seventeenth century. Few buildings were ever designed with a greater eye to proportion than the church which they saw restored to its original condition that day. It was rich in memories, and richest of all in the memory of one who worshipped there—Samuel Johnson, the most characteristic Englishman, perhaps, that England had ever produced.

Is a glass covering over an approach from a roadway to a building describable in law as a structure? That point may be settled soon, as the Queen's Bench has granted a rule calling upon a West London magistrate to show cause why he should not state a case with reference to a summons by the County Council against the De Vere Gardens Hotel, Kensington Road. The Council urged that the hotel managers erected a "structure" in advance of the general line of building in the road, but the managers deny that the awning comes within the meaning of the statute.

It appears that the County Council is exercised in spirit about the illuminated advertisements now so frequently to be seen at night in the principal thoroughfares of London. Our ædiles are in correspondence with the various local bodies with a view to the issue of regulations. The public—who will not forget that they owe to the Council the restriction, some years ago, of the hideous "sky signs"—would certainly approve of a by-law forbidding the advertisement of pills, soap, or whisky on the Nelson Column, the Westminster clock tower, or the dome of St. Paul's. As to the impropriety of thus degrading the dignity of public monuments there would be complete unanimity. With regard, however, to these advertisements in general there would be some difference of opinion, the Daily Graphic thinks. An intelligent democracy is often amused when the luminous lettering flashes into sight; and, after all, there is no accounting for tastes. Possibly the Council might forbid the thing in some districts while permitting it in others—if that would not imply an invidious distinction between the æsthetic perception of the classes and the masses.

LONDONERS of all classes will welcome the new railway from Waterloo to the City. As far as locomotion is concerned, the two great wants of London are relief for the present congested traffic and adequate means whereby passengers arriving at the great termini can be conveyed to the centre of the town. Doubtless if we had our railway system to construct over again, we should begin with a great central station. But as it is we must make the best of what we have, and accept the fact that being the pioneers of railway enterprise, we have had to suffer for making experiments by which other people now benefit. Still, there is much that can be done to remedy the original errors, says the Globe, and the Waterloo and City Railway is, at any rate, a long step in the right direction.

THE Duke of Devonshire, while at Windsor the other day, was able to inform the Queen that the question of the new buildings at South Kensington, which has been exciting the Art and Science worlds for some weeks, has been settled by the Government to the satisfaction of both parties. An agreement has been arrived at which will keep all the available ground on the east of Exhibition Road for the purpose of an extension of the Art Museum, while Science is to be allocated on the west side of that road, on the vacant ground facing the Imperial Institute. This is in accordance with the plan which has been warmly advocated by the Royal Society and the Royal Academy.]

THE recent landslip at Cromer is only the last of a long series of catastrophes which during the past thousand years have buried more than a mile of land in the sea. One looks in vain for any mention of Cromer in Domesday Book. It was then but a hamlet of the town of Shipden. But Shipden has lain now for many years at the bottom of the sea. At the beginning of this century it was still possible to discern the masonry of its church at low water. In those days Cromer was an inland town. But in 1837 an extraordinary gale drove the sea to such a height that the very existence of the town was in peril for many hours. Since then a breakwater has been constructed to protect the town. The neighbourhood, however, is gradually disappearing. At Sheringham a frigate drawing 20ft. of water can now ride at anchor where forty years ago there was a cliff 50ft. high. It has been found necessary to move various buildings inland. A lighthouse was built in 1719 several hundred yards inland, but in little more than a century this lighthouse had to be abandoned owing to encroachment and a new one built still farther away. The Cromer cliffs are very sandy, and are especially exposed to the action of the sea, as they encounter the full force of the drift from the north-east.

AN accident, by which one man was killed and several others narrowly escaped with their lives, occurred a few days ago at Hampton Court Palace. A gang of men were engaged in removing a wall in the Old Royal Kitchen Garden, with a view to making some alterations in the position of the barracks. Six men were engaged on this work. The wall had been undermined and cut through some days before, and a brick pier built at each end for its support. The men were just putting in the last few touches, preparatory to going round to the other side and pushing down the wall, when it was noticed that the wall was tottering, and it fell with a crash. All the men ran straight away from the wall except one, James Fallan, of Hampton, who ran sideways. He was nearly clear, when the top of the wall caught him, killing him outright. The others narrowly escaped.

THE Markets Committee of the City Corporation have presented a report as to the utilisation of the old fish market in Farringdon Road in still further extending accommodation at the Central Markets. They instructed the City Surveyor to prepare and submit a plan and estimate for certain alterations in the internal arrangements of the shops and providing a main entrance from Farringdon Road. After consulting the tenants, they thought the building should be adapted for the purposes of the colonial and other meat trade. The surveyor's plan showed twenty-two shops, a total area of 8482 square feet, and in most cases the shops increased in depth. The estimated outlay was from £8000 to £8500, and the estimated income was taken at a minimum rent of 2d. per foot per week. That income was set down at £6475, and the outgoings at £2460, leaving £4015 annually to meet the cost of the land and the original building.

THE public had an opportunity lately of seeing acetylene gas in operation and in process of manufacture at the Imperial Institute. An installation on a larger scale has been made at the Earl's Court Exhibition. The bright white light flashed from the Victoria Tower and lamps were fixed in various parts of the ground. The history of the gas is interesting. It was discovered by Sir Humphry Davy about sixty years ago whilst experimenting with potassium. In 1859 Berthollet named it "acetylene," but no commercial benefits resulted from the discovery owing to the difficulty of producing calcium carbide on a large scale. Subsequently a French chemist and an American chemist simultaneously hit upon the method of coke and lime fusion by the heat of the electric arc. It is said that there are now about a score of manufactories of carbide in different countries. As the manufacture increases, the cost of the material will be reduced to a point that will

make the gas the cheapest artificial light in the market. Its photometric value as an illuminant is given as fifteen times that of coal gas. It is comparatively cool and free from noxious vapours. The production of acetylene by the new process is an easy matter. In the generator is placed a charge of calcium carbide, and the lid screwed down. When a light is wanted a small quantity of water is allowed to mix with the carbide, which at once forms the gas ready for use. It is important to know that there is no danger in connection with the operation. Carbide calcium is not an explosive. If thrown upon the fire it will not burn, nor will it emit any light if hammered to a powder. It becomes effective only by the action of the hydrogen of water. The installation at Earl's Court covers the largest area of any display of the kind in England at the present time. It represents more than 12,000 candle power, with a search light which on clear nights has been seen from Epsom Downs.

LORD FRANCIS HOPE, brother of the Duke of Newcastle, sought the permission of the Court of Chancery to sell the valuable collection of Dutch pictures, eighty-seven in number, which had belonged to Mrs. Hope, of Deepdene, Dorking, who died in 1884, leaving large estates to Lord Francis. Since their public exhibition, on loan to the nation, the collection has been in the custody of the Duke of Newcastle, but as his residence in Hill Street is being renovated, there is no home for the pictures. One learned counsel said he had a client who was prepared to offer £110,000 for the collection. Another lawyer said he also had a client, who had already offered £105,000, and paid a deposit of £9000, and he was now prepared to increase this offer to £111,000, the offer to remain open till Monday, July 25th. Mr. Justice Romer made an order for the sale, and directed it to take place in Chambers, by tenders, which should be lodged on or before July 25th, the lowest tender to be £111,000.

MESSRS. CHRISTIE, MANSON, AND WOODS have just sold a collection of relics of Marie Antoinette, Louis XVI., and La Dauphine Marie-Thérèse de France, and also a variety of porcelain, objects of art, and decorative furniture from numerous private sources. The principal articles included a pair of famille-verte beakers, enamelled with peonies, &c., in shaped panels, 9in. high, 50 guineas; an old Chinese cylindrical-shaped vase, powdered blue ground, pencilled with foliage in gold, and enamelled with branches of foliage in brilliant colours, 105 guineas; a cylindrical-shaped vase of old Chinese porcelain, famille-verte, enamelled with scroll foliage, &c., in green and red, 50 guineas; a pair of famille-verte eggshell lanterns, with mirror-shaped panels of kylins on a dotted groundwork, 48 guineas (the lanterns were from the Arkwright collection); a globular cistern of old Nankin porcelain, painted with kylins, ribbons, and balls in blue, 60 guineas; a collection of 100 spurs, many of the highest quality and rarity, formed by Herr Richard Zschille, and fully described in his work, "Die Sporn," 100 guineas; a gold enamel pendant, Italian sixteenth century, cruciform in shape, and composed of interlaced strapwork, 90 guineas; a gold and enamel necklace, German sixteenth century, composed of twenty large and twenty small oval links, of pierced strapwork design, enamelled in red, blue, and white, 190 guineas; an oviform vase and cover of old Derby porcelain, painted with a coast scene and vessel, and a landscape with ruins, and a pair of oviform ewers *en suite*, 70 guineas; an old crown Derby dessert service, made for the Princess Charlotte on her marriage with Prince Leopold, afterwards King of the Belgians, and purchased at the Marlborough House sale by the father of the late owner (Mr. Giles Redmayne, of Brathay Hall, Ambleside); the service is dark blue ground, richly marbled with gold, and painted with named views in England, Wales, Scotland, and Italy in colours, 100 guineas; and a pair of candelabra with seated figures of a lady and gentleman holding baskets of flowers, of old Dresden porcelain, 62 guineas.

THE fame of Lord Mayor "Jack" Wilkes is perpetuated by what is undoubtedly one of the ugliest monuments in the City; the obelisk on the south side of Ludgate Circus. The Common Council has lost an admirable opportunity of abolishing that monstrosity, or at least replacing it by something a little more æsthetic. The ungainly lump of stone was recently taken down and set back a considerable distance in order to accord with the new alignment of Fleet Street. It is now, however, ready to be once more restored to the public gaze, and the hoarding which has been around it so long is to be removed in a few days. Some may have thought that if the Corporation had not the heart to break the obelisk into material for repairing roads they might have left biting Time to gradually crumble it into dust, but they seem so anxious to preserve that they have actually given such a new lease of life as is derivable from two coats of paint.

DURING some recent excavations at the Kingston Baths, Bath, a lead consecration cross, believed to be of the period of the seventh century, was discovered. The cross is worked on a circular plaque about 3in. in diameter, and bears the names of the four Evangelists together with a Latin inscription, in a perfect state of preservation, with the exception of the date. It is the first specimen of Christian antiquity discovered in connection with the baths of Bath. At the last meeting of the Baths Committee the cross was produced by Major Davis, the city surveyor of works, who was requested to confer with the authorities of the British Museum with a view of obtaining an authentic report upon it. Major Davis stated that it was exceedingly valuable, and that nothing like it had ever been found in England before.

As straws show which way the wind blows, two recent occurrences in Paris indicate the leaning which Frenchmen have towards the art of sculpture. The Academy of Medicine recently elected two doctors, Messrs. Paul Richer and Ribemont-Dessaignes, to chairs. Both of these are almost as distinguished as sculptors as in their regular profession. The Council General of the Seine accords every year five purses of £50 to deserving artists entering on their profession and displaying talent. The candidates who had adopted sculpture were twice as many as the painters, and they obtained an equal share in the awards. In England painters outnumber sculptors by at least fifty to one.

IN a local paper in Jamaica, called *The Gleaner*, a correspondent gives an interesting account of a Jewish cemetery he has discovered in Lacovia, a small negro village in the colony which has seen better days. This village was once the centre of great activity and the scene of many military achievements; now, nothing but ruined barracks, vaults, and decayed mansions witness to its departed glory. It is on the main road from Santa Cruz to Black River that the cemetery lies. It is 150 years old, but it was unknown even to the oldest inhabitants, many of whom shook their heads in doubt when the discovery was made known. A representative in Jamaica of Sir Walter Scott's "Old Mortality" managed to find and clean eight slabs, the inscriptions of which became perfectly legible in the process. These represent but a small proportion of the total number of tombs in the cemetery. "Many," he says, "are no doubt deep beneath the soil, judging from the inequalities of the land; many have perhaps been stolen, and the balance employed as grindstones—a vile practice in these parts." He notes an interval of fifty-five years between the oldest and the latest inscriptions of the slabs he unearthed—a period which must have witnessed many Jewish burials—especially when we consider the hot and malarial condition of the island in which it is situated, and, he pertinently asks, "What has become of these tombs and monuments?" There seems little doubt that they have suffered the same fate as the beautiful slabs and carved monuments in other cemeteries.

IN the third Rural Vignette, in the Land Magazine, Mr. J. A. Benson remarks that notwithstanding the activities of estate architects and builders who, in the prosperous years of thirty or forty years ago, seriously threatened to pull down every old farmhouse in the country, replacing them with houses more in accordance with architectural ideas of those years, there are still a considerable number untouched by the ruthless hand of the estate improver. Here, nestling beneath the hill in a rich pasture, studded with lofty elms and mossy old apple trees, with a fruitful orchard a little distance removed, and on a higher point of the uplands the luxurious grass everywhere veiled with the gold of buttercups, stands one such old farmhouse, as distinctly ancient as the old hall in the valley beyond, which was built in the reign of King Henry VIII. No jerry-builder was employed at impossible terms to place this rural domicile in the landscape. The building is still substantial, and every stone as upright as when placed in the building by the plumb-rule of the mason. Although the old roof is a paradise of the birds, whose callow broods are continuously crying out from the eaves for the dainty morsels which the greensward affords them, the tiles, spangled with the grey and gold of lichen and moss, are in perfect order.

THERE is shortly to be offered for sale by auction in London one of the most interesting and historical properties situate north of the Tweed. This is the beautiful ruin of Ardchattan Priory, on the north side of Loch Etive, Argyllshire, where Robert Bruce held a Parliament. It was built by John MacDougal in the thirteenth century, and was burned by Colkitt during Montrose's wars.

MR. ARMSTRONG retires from the Art Directorship of South Kensington Museum, and the candidates for the post are three. Professor Herkomer is understood to be out of the running, and the choice lies between Mr. Alfred Gilbert, R.A., and Mr. Walter Crane. Between these two eminent and accomplished artists the wiser appointment, it is said, would be that of Mr. Walter Crane. He knows by personal contact with the students of Manchester and Reading the practical side of art teaching. Still more, he is a man of ideas and convictions. If once such a man gets fixed at South Kensington there is no saying what a fine future may be in store for English decorative art.

THE Royal Academy's architect has been consulted about alterations in the rather gloomy premises of old Burlington House, which is the Keeper's residence for the official year of nine months, for his duties, though not exactly onerous, are constant. He has to attend every Council, and exercises a kind of general supervision over all the school's, though of course the Visitor of each has the control over his own department. He ranks after the treasurer, and is practically one of the vice-presidents of the Academy. The post is therefore one which requires to be filled by a man of tact, of varied accomplishments and of weight with his brethren. There is a general impression that the choice will lie between Mr. Davis, Mr. Yeames, and Mr. Crofts.

It has been proposed by the Dean of Rochester that the Freemasons of this country should provide funds for rebuilding the central tower of the Cathedral. At the present time Rochester Cathedral has a modern central tower erected in the year 1827, from the designs of Cottingham, an architect of considerable reputation in his day, not only in England but also on the Continent. Among other works the western tower of the Cathedral at Bruges was carried out from his drawings. We presume that it is proposed to take down the central tower at Rochester, and attempt a revival of that which formerly existed in its place. This was a low square lantern, crowned with a wooden spire, supposed to have been the work of Gundulf, who built the nave of the Cathedral. In "Winkles

British Cathedrals" we are informed that "a spire erected in 1749 has been recently removed," but King's engraving in the 1655 edition of the "Monasticon" shows the original tower and an ancient spire of somewhat remarkable form. It appears to have been square in plan, spreading out with a curve at the base, and having a V-shaped sinking on each side. The tower is very plain, with a single window on each side and an arcade rising as high as the apex of the transept roof. There are many views showing the tower with the 1749 spire, but King's is probably the only drawing showing the earlier one. What is usually called "Gundulf's Tower" is a very solid ruin attached to the north transept. It appears to form no portion of any scheme for the existing cathedral, and was either abandoned or partly pulled down when that was carried out. It may have been intended to serve as an isolated bell tower or some defensive work. With regard to the existing central tower of the cathedral, although its detail is poor the effect from a distance is not unpleasing, as its outline is good and the colour unobjectionable.

A YEARNING for æstheticism is evidently not the ruling passion of the City Press, as witness the following:—"Our advertisement hoardings are perhaps scarcely things of beauty—though to be sure they are far more pleasing to the eye than was the case a few years ago; but, at the same time, there is no reason why the public purse should suffer in order that the whims of the æsthetically minded may be pandered to. At the meeting of the Metropolitan Asylums Board one member suggested that the hoarding round the site for the new offices should not be let for advertising purposes, and declared his belief that the ratepayers as a body would willingly forego the money that would be received in the ordinary way. Happily the majority thought otherwise, and common sense gained the day. Why the ratepayer should suffer in order that a faddist may not have his sense of beauty disturbed is altogether beyond comprehension."

A NEW window has just been dedicated in the Lady Chapel of Winchester Cathedral. The window is the gift of the citizens of Winchester, and is in commemoration of the sixtieth year of the reign of Her Majesty the Queen. The total cost, including erection, is £300. The window consists of two rows of seven lights each, and elaborate tracery in the head. The main subject is the doctrine of the Incarnation—the Royal line of David culminating in Jesus Christ. At the base of the window, in the centre, is a small figure of the ex-Mayor of Winchester, in robes of office, as representing the citizens who are the donors of the window.

THE members of the Royal Archaeological Institute have been holding a congress at Lancaster. The programme included an excursion to Furness Abbey, and then on to Barrow and Peel Island. On arrival at the site of the famous Abbey it was described by Mr. W. H. St. John Hope, assistant secretary of the Society of Antiquaries, and his description included the results of the excavations carried on at the Abbey during the past three years, including the discovery of what is believed to be the Abbot's kitchen. It seems to have been of the thirteenth century, and to have had a fireplace with projecting hoods. It also had a groined roof springing from a central column. Mr. Hope has recently completed the greater part of a new ground plan of the Abbey, which shows all the later discoveries. Subsequently the party proceeded to Peel Pier, and by boat to Peel Island, where they visited the Peel of Fauldrew, which was also explained to them by Mr. Hope. In the evening the historical section of the Institute was opened at Lancaster by an address by Mr. J. Holme Nicholson, M.A., president of the Lancashire and Cheshire Antiquarian Society. A paper was afterwards read on "The History of Lancaster School," written by Mr. A. F. Leach, F.S.A.

A NEW HOTEL IN EAST ANGLIA.

THE Cliff Hotel, Gorleston, has just been completed. The designs are by Messrs. George I. Skipper, F.R.I.B.A., and F. W. Skipper, architects, of Norwich. The exterior of the building is of simple treatment, the style is leaning towards Scottish Renaissance. Reliance has been placed by the architects on the grouping and proportion of parts for the main effects. The west front is perhaps slightly more domestic in spirit, but the same treatment has been preserved. The main entrance is by a low, wide archway, with a band of carved brickwork running round the soffit. Above this arch is a series of windows and panelled work of faced flints, inclosed between two shafts, on which two heraldic lions are placed, and, above all, is a strongly designed parapet. The interior provides a spacious central

HALL OF IRREGULAR SHAPE,

the sea front windows looking out under three arches. From this hall access is given to nearly all the important parts of the hotel. The staircase starts here under an oak entrance on the right hand, and goes up to a landing contrived above this doorway. The fireplace is in stone and oak, under a broad arch, with seats on each side. Corridors run from this central hall, and on one side give access to a lounge hung with rich Japanese wall paper and strongly coloured naturalistic window glazing, to the billiard-room, treated with heraldic wall hanging, to the smoke-room, treated in a deep tone of blue and yellow, and to the gentlemen's lavatory. The drawing-room is entered from this corridor and is hung with choice French wall hangings. Here there is a

CARVED WOOD CHIMNEYPiece.

The whole of the wood work is enamelled cream. The glazing in the windows has been kept specially light and elegant in design, so as to produce a suitable effect for this room; and the gas brackets are in polished brass. On the other side of the central hall is a well-lighted airy reading-room, and beyond this is the dining-hall, an apartment treated with wood panelled walls to a height of about 8ft., and painted a green colour, and above a deep frieze tinted red. The ceiling is divided by wood beams and the panels filled with a decorative plastic material. From the ceiling and walls are suspended quaintly designed gas fittings and brackets with amber glasses. The windows are filled in the upper parts with strong and characteristic lead glazing, giving richness of effect. The chimneypieces are of stone, very quaint in design, massive and yet quiet, with niches and arched openings, with deep red tile hearths and kerbs, and quaint wrought and bright iron dog grates with green backs.

DECORATED WITH HERALDIC LIONS.

The surrounding and upper part of the chimneypieces is wood panelling, as also is the upper part of the doors, going quite up to the ceiling. The doors are mahogany, of rich design, the upper panels with arches and columns, and filled with lead glazings. Altogether this room has, like the rest of the interior, a treatment quite of its own in simplicity and quaintness, giving an old-house-like appearance to the whole place. The arches in the corridors are broad and low, with keystones reaching to the cornice. The decorated parts are richly treated, but general surface parts are plain. On the upper floors spacious corridors, broad, well-lighted, and sunny landings, well-appointed baths and sanitary arrangements, go to make the comfort of the bed and sitting rooms complete. Balconies are provided for many of these upper rooms. The kitchen in the basement has, for the greater part of it, an open roof for light and ventilation. The cooking is by a central range and other appliances. The walls in the basement are nearly wholly lined with glazed Cockrill-Doulton wall tiles, and every provision is made for the good service of the place in every department.

ARTISANS' DWELLINGS.

WHAT MANCHESTER HAS DONE.

AMONGST provincial cities, Manchester has taken a leading place in the attention which its Corporation has paid to the clearing of insanitary areas, and the provision of dwellings for the working class. It possesses a notable block of labourers' dwellings in Oldham Road, built by the City Council, which, however, is not the only scheme of the kind that has been carried through. These buildings occupy a site which contains a superficial area of 7842 square yards. They all have frontages to the main street, and cover about 3430yds. of the site. In order to secure a spacious recreation ground, the architects, Messrs. Spalding and Cross, provided a large central quadrangle, which is enclosed by a light iron fence. There is nothing of

THE GLOOMY BARRACK LOOK

about this block that in some erections put up for a similar purpose repel the very people they are intended to attract as tenants. The fact that shops take up the whole of the ground floor fronting Oldham Road is largely responsible for the attractive appearance of the structure. These are so arranged that they can be used by the occupants of the dwellings, or by those who, living elsewhere, rent them as lock-up shops. At the corner of the other façades are large double-fronted shops, which also help to get rid of the monotonous effect so invariably associated with long frontages. Much of the prejudice against Scotch flats in the minds of people this side of the Tweed is because of the narrow, badly-lighted staircases which lead to many of these homes. But in this Manchester building there is not that drawback. The staircases are of good width, and in straight flights, and give direct access to the external corridors and the laundry department on the attic floor. Windows on the level of each floor, and large top skylights afford ample light, and the

NEED FOR PROPER VENTILATION

was not overlooked. The tenements vary in size, but the height of all rooms is 9ft. In the one-roomed tenements the average size is 130 square feet and 1170 cubic feet, and in the two-roomed tenements one of the rooms contains about 174 square feet and 1566 cubic feet, and the other about 108 square feet and 972 cubic feet. There are 237 double tenements for families of four or five persons, and forty-eight single tenements which are for one person. Each of the sixteen shops has a cellar, and there are four laundries. Every dwelling has a well-ventilated food store, and also a place for storing coal. Good sanitary arrangements are essential for the successful working of such a scheme as this, and what was done in this respect met with the approval of the Local Government Board, the stringency of whose requirements in undertakings of this sort is well known to those whose duty it has been

TO SUBMIT PLANS

to them. The laundries are on the attic floors. Connected with them are commodious drying rooms, and this important department of any healthily conducted dwelling is easily reached from the staircases. Local "commons" bricks were used for the construction of most of the walls, with red terra-cotta and moulded brick strings, sills, and salt-glazed brick dados, but the façade to the Oldham Road is faced with local red stock bricks, and contains ornamentation enough to make it attractive. The whole building covers a square bounded by four streets, and the cost was a little over £50,000. The cost of the land to the Corporation, who, in sweeping away the insanitary area, had to buy half-a-dozen public-houses, besides the goodwill of a number of shops, was calculated at £5 per square yard, and £90,000 may be roughly stated as the cost of the experiment, which followed a similar but smaller one made by the Manchester Corporation in Pollard Street.

STREET IMPROVEMENTS.

A NOTTINGHAM SCHEME.

A SCHEME of street improvement is on foot at Nottingham. The formation of a new street from Lower Parliament Street to the south-eastern part of the city, and the widening of certain streets in connection therewith, is proposed. The question of providing an improved means of communication between the centre of the city and the large and growing district on the south-east side thereof has been under consideration for some time past. This matter has now become very urgent, owing to the construction of the New Central Railway Station, and the necessity for obtaining a route for the extension of the tramway system to Sneinton and the adjoining districts. The city engineer has prepared a plan of the proposed new road, showing that the improvement will commence by the widening of Lower Parliament Street, St. John's Street, and Cur Lane, and be continued by the formation of a new road through property lying between Platt Street and Colwick Street, in a direct line to Southwell Road, near its junction with Sneinton Street, including therein a widening of Southwell Road on the south-east side thereof. The width of

THE PROPOSED NEW ROAD

will be 70ft. The greater part of the property which will be required to be taken down to carry out the improvement consists of small back to back dwelling-houses of old and inferior construction. It is proposed in dealing with this improvement to acquire the whole of the properties lying between Platt Street and Colwick Street, and on each side of the intended new road as far as Southwell Road, with the view of clearing away a class of property which it is undesirable in the interests of the public health should be continued, and of providing valuable sites fronting the new road for disposal after the improvement has been completed. The cost of the improvement cannot at present be accurately determined, but the city engineer estimates it approximately at £235,000. The Improvement Committee of the Nottingham Corporation also propose the provision of working-class dwellings in connection with the new street improvement from Lower Parliament Street to St. Ann's Well Road. An application has been made to the Local Government Board for its approval of the scheme for erecting working-class dwellings on a portion of the Corporation estate on Coppice Road, to provide for persons who will be displaced by the

PULLING DOWN OF HOUSES

in connection with the street improvement from Lower Parliament Street to St. Ann's Well Road. After a public inquiry the Board has intimated that it is prepared to approve of the scheme. The scheme provides that the Corporation shall erect 100 dwellings of the description approved by the Board, on the site on the Coppice Road, as follows:—The first fifty within twelve calendar months, and the remaining fifty within eighteen calendar months from the approval of the scheme by the Local Government Board. The scheme further provides that the Corporation shall not, before the 100 dwellings to be provided in pursuance of the scheme are completed fit for occupation, demolish more than 140 of the houses required for the improvement now occupied wholly or partially by persons of the labouring class, and the persons residing in the remainder of the said houses shall not be displaced until the said 100 dwellings are completed fit for occupation.

The latest of the Rowton Houses has proved as successful as all the others, and another great building is rapidly rising for the accommodation of the poorest class of Londoners. The company has now shifted the scene of their operations to Hammersmith. This new house will be intended for 800 occupants, and will be somewhat more imposing than some of the others, since there will be no basement floor. All will be above ground.

Professional Items.

ABERDEEN.—It is proposed to erect a new Unitarian church in Aberdeen. The site is on the north side of Skene Street West. The new church—which will be built entirely of granite—would stand with its gable towards the street, this gable forming the main front, and carrying the chief architectural features. The gable front would have a width of about 45ft., and a height, from the pavement level to the apex of the pediment, of 50ft. A double doorway is formed under a semi-circular arch, with alternately-projecting arch-stones. At each side of the doorway rises a slender column, with moulded base and carved capital; whilst beyond this rise, on each side, more massive pilasters. Above the main entrance a bold moulded cornice runs along the entire front. Still higher, the idea that prevails in the design of the entrance is developed in the large gable window, which is divided into six lights by pilasterettes, while the entire design is enclosed by pilasters corresponding to those in the lower part of the front. The architects are Messrs. D. and J. R. McMillan, Union Street.

DUBLIN.—During the past three months the Church of St. Teresa, Clarendon Street, which is the oldest Catholic church in Dublin, has been undergoing improvement at the hands of the decorator. Improvements have been effected both in the lighting and ventilation, and in the artistic colourings of the decorations. The ceilings of the nave and transepts are divided into panelling with lines and delicately-tinted styles. In the centre of each panel there is a bold, floriated design in various shades of neutral colours on a soft vellum ground, all tending to elevate the structure. Under the ceiling there is a bold frieze created after the same manner. The walls are divided into two shades, the upper portion of which is in a neutral green. The lower portion is a rich terra-cotta, surmounted with an elaborate string course of good design in stronger colours than the fringe above. The principal portion of the ceiling is the panel over the chancel. It has been treated in a style that has rarely been attempted in this country. The chancel arch is supported with massive pillars, with capitals very rich in colour and ornately gilt. Over the capitals is an ornamental frieze in gold on a crimson ground. The upper portion of the apse wall contains many striking medallions representing the four doctors of the church, surrounded with elaborate scroll work and other decorations. The work has been under the supervision of Mr. W. H. Byrne, architect, Suffolk Street, Dublin.

GORLESTON.—The general contractors for the new hotel buildings, of which we give a description elsewhere, are Messrs. J. Downing and Son, of Norwich. The shops and terrace below have been built by Mr. J. F. W. Bray, of Great Yarmouth. The furnishing throughout has been in the hands of Messrs. Trevor, Page, and Co., of Norwich. The stoves and ranges, and hot-water service, &c., were supplied by Messrs. Johnson, Burton, and Theobald, of Norwich. The ornamental glazing and the decorative painting was entrusted to Messrs. J. and J. King and to Mr. W. R. Weyer, of Norwich. Messrs. Varity, of London, supplied the gas fittings; and Mr. A. R. Pank, of Yarmouth, the gas engine, boiler, and the gas fittings generally. The laundry fittings are from Messrs. T. Bradford and Co., and the stable fittings by the St. Pancras Iron Company. Mr. W. J. Baye acted as clerk of the works.

LEEDS.—Holbeck's share in Leeds improvement schemes promises to be fairly substantial. With building operations still proceeding in the outlying parts there is every likelihood of important developments in the near future. Internally, too, the signs of advancement seem good. The Holbeck and West Hunslet Sanitary Association are continuing their agitation for the opening up of what has now become known

as the Holbeck insanitary area—a group of streets and alleys in the heart of the populous district west of Meadow Road. So far as plans go there would appear to be no reason why, in course of time, Holbeck should not be transformed equally as well as East Leeds will probably be in a few years. The widening of Nineveh Bridge has paved the way for a new main road through the locality, and the proposed formation of a new street placing Sweet Street in direct connection with Victoria Road suggests still further possibilities. Again, whatever opinions may obtain regarding the institution of a theatre here, the substantial structure at the corner of Jack Lane and Meadow Road, now rapidly progressing, gives a decided air of importance to the neighbourhood.

PEEBLES.—The Peebles Hydropathic has just been opened. Built a dozen years ago or more at a cost of nearly £90,000, from designs by the late Mr. Starforth, Edinburgh, this building, externally and internally, presents a very handsome aspect. It is placed on an elevated situation to the east of the town, and with a southern exposure; it commands an extensive and varied view of the Tweed valley. Internally the house was originally constructed in the most modern fashion, and what experience showed it lacked has been supplied in the thorough overhaul it has received, at a cost of several thousands of pounds. The large public rooms open upon a wide corridor running from one side of the building to the other; and few finer rooms than the drawing-room, with its beautifully panelled plaster ceiling, will be found in any mansion in the country.

SHERINGHAM (Lincs.).—A new hotel has been erected at Sheringham. The hotel is built of red brick and white stone, with white brick Cossey ware dressings. Over the central entrance, which is approached by a flight of circular steps, are fine bay windows, with gable. At the north-east and north-west corners are octagon turrets, which finish up in the form of cupolas in copper, and surmounted by finials. On either side of the principal entrance, and between these two turrets, are bay windows. On the north-west side of the hotel is the winter garden, with its sun gallery, colonnade, and verandah, sheltered from cold winds, but always commanding a fine expanse of scenery towards the golf links and the Sheringham Hall woods. The main entrance of the hotel opens out into a lofty, airy and spacious central hall. To the right and left of this run wide corridors. That on the west side leads to the reading, smoking, and billiard rooms, that on the east to the dining and drawing rooms. The staircase is lighted with circular stained glass windows, with nautical representations of various epochs in English history. The first represents a vessel of the Viking period, the second of the Norman, and so on. The central window in the first flight represents the Royal Arms of England, and the central one in the second contains the Sheringham crest, two lobsters and a crab. On the first floor there is a well, with balustrades and four white columns, which look down into the central hall and adds to the ventilation and air-space of the building. On the first three floors the corridors run east and west, and near their extreme ends are intersected by shorter corridors on the three floors, for at the third the main staircase ends. Sanitation and ventilation have been studied to the utmost, and everything done that can add to the comfort and give satisfaction to visitors. The architect of the work has been Mr. Herbert J. Green, of Norwich. Messrs. J. Youngs and Son, of Norwich, were the contractors; while the entire furnishing and decorating has been carried out by Messrs. Trevor, Page, and Co.

The foundation stone of St. Patrick's new church, Lisburn, was laid last week.

The fifth ward of the Great Central Hospital—a fine circular room in a hospital regarded as a model institution—has been opened.

Correspondence.

APTITUDE IN CRAFTSMANSHIP.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Having a few hours to spare during last week, I paid a visit to the exhibition of work executed by children in the day and evening schools of the London School Board, at Hugh Myddleton School, Clerkenwell. The work of the manual training pupils in wood-work centres naturally mostly attracted my attention, appealing as it did to my regard for craftsmanship. Some of the work exhibited seems to me almost too well done and "finished" to be executed by boys, though I am told that all the work shown is done by the boys without the hands of the teacher touching the work, except to point out the faults. I can only say that I wish all the mechanics I have come across could work as well; if it were so, the craftsmanship of this age would rival the craftsmanship of those golden ages when everyone who did anything did it well. I believe it is not the aim of the London School Board to make the boys into craftsmen, but only so to teach them that they will do, with truth and accuracy, all that comes to them. I think, however, that any latent mechanical powers the boys possess must be developed by the training, and that we might gain something as a nation if we studied this in considering what trade or profession a boy should enter. Cannot somebody, such as the London County Council, hold an examination of those who are about to leave school, with the idea of apprenticing a few of the best in manual training to some trade? While objections might be raised to this proposal, it cannot be worse than what some charities do by apprenticing boys to trades for which they are utterly unsuited. In the case of poor boys it would be necessary to provide a few shillings weekly to compensate the parents for what they would lose by the scheme, but this would only be for the first year or so, and would not be more expensive than half the scholarships and exhibitions now offered, and which I am inclined to think sometimes help those who do not need it.—Yours very truly, "EVER ONWARD."

It is stated that one of the largest purchasers of Burne-Joneses at the moment is a South African millionaire, who has taken a great liking for his work, and telegraphs over unlimited commissions, without even having previously seen the pictures he acquires. He has purchased the "Mirror of Venus" amongst others.

The laying of the foundation stone of the William Terriss Memorial Lifeboat House in the Wish Tower Grounds at Eastbourne took place on Saturday week. The design for the lifeboat house has been prepared by Mr. W. T. Douglass, engineer and architect to the Royal National Lifeboat Institution.

The Dundee Institute of Architecture Science and Art have issued their syllabus of competition for the session 1898-99. Awards are to be given for the following:—Best free-hand sketch-book of architectural subjects; best measured drawing of any architectural subject; best work in modelling or carving; best sepia drawing; best design in colour; and for the best design for a public tramway shelter.

The Governors of the Royal South Hants Infirmary, Southampton, met to consider the question of a new wing to that institution, which is about to be built in commemoration of the Queen's Diamond Jubilee, and to which her Majesty subscribed. The Mayor's fund fell short of what was expected, and it was therefore determined to adopt a smaller scheme with fewer beds, but, to save this and to secure that it should be an adequate memorial of the Jubilee, a local resident offered to pay the cost himself over and above the Mayor's fund. The additional cost will amount to about £5000, and thus accommodation will be provided for fifty beds. This institution has already a wing as a memento of the Jubilee, and just recently a beautiful new pulpit has been supplied to the chapel.

Enquiry Department.

ON THE USE OF HALF-TIMBER WORK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In a recent issue of your journal there appeared an article on "Design and Detail of Domestic Buildings," by John E. Newberry, A.R.I.B.A. The sections show the half-timber work carried up, with wood framing and three thicknesses of plaster. Would this be sufficient? The Model by-laws require the spaces between the timbers to be filled completely with brickwork, and to have at least 4½ in. brickwork at the back of same, properly bonded to the front portion. If brickwork were used, would the short joists, tusk tenoned into the main joists (as shown on section), be sufficient to carry the extra weight for the two floors in the gable end?—I am, Sir, yours sincerely,

"AN OLD SUBSCRIBER."

As to whether wood framing and three thicknesses of plaster are sufficient to keep out the weather and render a building warm, I say emphatically yes. Such a mode of construction has been adopted in buildings designed by the late Mr. J. L. Pearson, R.A., Mr. Norman Shaw, R.A., and Mr. T. E. Collcutt, and, if properly executed, is perfectly satisfactory. But in districts where the Model by-laws are in force, I would advise no one to attempt the use of half-timber work at all. The brick filling in and backing destroys its constructive principle altogether, and a solid 9 in. wall is more satisfactory than one with bits of timber built in it. Corbelling out such a wall on wood joists would be unconstructive, and a totally wrong use of materials.

JOHN E. NEWBERRY.

Under Discussion.

ARCHÆOLOGISTS IN LONDON.

The Bristol and Gloucester Archæological Society, in its recent exploration of London, visited many historic spots, linking them with Gloucestershire and Bristol history. The Lord Mayor received the Society at the Mansion House, and Sir Stuart Knill at the Guildhall. Viscount Dillon met the members at the Tower to describe its famous armour, and among the City Companies who received the Society were the Brewers, Mercers, Armourers, Drapers, and Barber-Surgeons. The whole week was amply filled up by visits to Lambeth Palace, Westminster, famous City churches, and other noted show places, ending with a call at Silchester on the return journey to the Western county, when Mr. St. John Hope described his discoveries of the Roman city. We referred to the principal excursions of the Society at some length last week.

The foundation stone of a new church at Clonakenny, Ireland, has been laid.

The foundation stone of the new Herts County Museum was laid last week.

A SPECIAL general meeting of the Architect's Benevolent Society was held in London last Wednesday week, when the following resolution, passed at the annual general meeting, was confirmed:—"That the words six pensions of not less than £20 each be substituted for three pensions of not less than £15 each in by-law 65."

NOTICE is given that the Guildhall Library will be closed for the repairs which have already been decided upon by the Court of Common Council. The repairs include the refurnishing and refitting of the reading-room, the redressing of the stonework of the building, the repainting of the interior, and the renovation of the exterior portions.

The London County Council has refused to contribute to the proposed widening of Lothbury. The scheme is not an ambitious one, but the widening, if it is effected, will materially relieve the congestion of traffic in the neighbourhood of the Stock Exchange. What is more, it will pave the way for the much-needed widening, later on, of Gresham Street.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERCYNON.—For the erection of twenty-four houses for the Mountain Ash Navigation Club. Mr. A. O. Evans, architect, Post Office Chambers, Pontypridd:—
J. Bowen ... £2,300 W. James ... £3,816
W. Small ... 4,173 James Howell's ... 3,768
Rees Francis ... 4,080 Jones and Jenkins ... 3,649
Dd. Thomas ... 3,966 Lewis Davies, Aber-
F. Mills ... 3,948 cynon* ... 3,528
*Accepted.

ABERGAVERN.—For the erection of temporary wooden buildings at the Monmouthshire Asylum. Mr. B. J. Francis, architect, 12, Cross-street, Abergavenny. Quantities by architect:—
Rees Bros. ... £4,729 0 0 Watkin Williams £3,550 0 0
Keay ... 4,465 0 0 Geo. Davies ... 3,545 0 0
D. Rowell & Co. ... 4,097 2 8 H. Gibbon ... 3,535 0 0
Humphreys ... 4,040 0 0 G. Martin & Son ... 3,495 0 0
T. S. Foster ... 4,175 0 0 T. J. Hawkins ... 3,420 0 0
Smith ... 3,993 0 0 Bowers and Co. ... 3,410 0 0
Harbrows ... 3,870 0 0 P. Gaylard, Bridg-
Mitson ... 3,675 0 0 end, Glam.* ... 3,400 0 0
Baker and Co. ... 3,550 0 0 ham* ... 2,631 12 0
*Accepted.

ASTON MANOR.—For additions to hospital. Upper Wotton, for the Urban District Council. Mr. H. Richardson, C.E., Council House, Aston Manor:—
R. M. Hughes ... £2,141 Reeves and Son ... £1,910
J. E. Moorhouse ... 2,062 W. Hopkins, Birming-
W. and A. Heaps ... 1,963 ham* ... 1,833
*Accepted.

BIRTLEY (co. Durham).—For the erection of Primitive Methodist chapels and schools. Mr. E. Clephan, architect, 8, Nicholas-chambers, Newcastle-on-Tyne:—
J. Bemley ... £3,492 11 0 Davison & Bolam,
W. Lodge ... 3,483 9 0 Birtley, co. Dur-
J. M. Braithwaite ... 3,389 6 0 ham* ... £2,631 12 0
T. Craven ... 3,310 11 8 *Provisionally accepted.

BOOTLE (Lancs.).—For the erection of an electric-light station, Elm-grove, for the Corporation. Mr. J. A. Crowther, Borough Engineer, Town Hall, Bootle:—
John Corkhill ... £7,261 Peter Tyson ... £7,000
Hughes and Stirling ... 7,150 Samuel Webster ... 6,450
J. Paterson and Son ... 7,037 Walter Musker* ... 6,598
*Accepted.

BRENTWOOD.—For additions to Sunday School buildings, for the Trustees. Mr. C. Pertwee, architect, Bank-chambers, Chelmsford. Quantities by Messrs. R. L. Curtis and Son, London-wall, E.C.:—
J. Smith and Son ... £1,038 F. J. Wilding ... £295
A. Brown and Son ... 1,023 F. Johnson ... 920
Silas Parmenter ... 1,000 Rogers & Robson, Brent-
Ernest West ... 968 wood (accepted) ... 857

BRYNAMMAN (Wales).—For additions to Siloam Chapel, and the erection of a vestry. Mr. Tracey, architect, Post-office, Glanamman, Carmarthenshire:—
Walters and Johns ... £1,120 0 D. Rees ... £1,293 0
J. Howells ... 1,319 14 John Morris, Bryn-
J. D. Howells ... 1,119 0 amman* ... 981 0
J. Williams ... 1,150 0 *Accepted.

CARDIFF.—For the erection of new hotel, stabling, &c., Lansdowne-road, Canton, for Messrs. W. Hancock and Co., Limited. Messrs. Veall and Sant, architects:—
W. Thomas & Co. ... £2,449 Lattey and Co. ... £5,968
Knox and Wells ... 6,325 Turner and Sons ... 5,898
C. C. Dunn ... 6,147 J. Allan ... 5,750
Shipton & Son ... 6,118 W. Symonds and Co.* ... 5,693
C. & F. Couzens ... 6,110
(All of Cardiff.)

*Reduced to £5,050 and accepted.

CARDIFF.—For the erection of new premises, Neville-street, for the trustees of the Riverside Conservative Club. Messrs. Veall and Sant, architects:—
E. R. Evans and ... Turner and Sons £2,598 0 0
Bros. ... 2,845 0 0 Knox and Wells ... 2,557 0 0
Lattey and Co. ... 2,793 0 0 Melhuish Bros.* ... 2,497 10 0
Mathias and Son ... 2,750 0 0 W. A. Walters
C. C. Dunn ... 2,673 9 9 (withdrawn) ... 1,980 4 5
W. T. Morgan ... 2,660 0 0 [All of Cardiff.]

*Reduced to £2,398 and accepted.

CARLISLE.—Accepted for the erection of the Newtown Mission Room. Mr. C. J. Ferguson, architect, 50, English-street, Carlisle:—

Building—J. and W. Baty	£360 0 0
Joinery—Thos. Lawson	430 16 6
Slating—C. J. Nanson	103 6 4
Plastering—S. Ferguson and Sons	133 0 0
Painting—R. S. Kirk	64 5 0
Plumbing—W. Anderson	74 6 8
Total	£1,365 14 6

[All of Carlisle.]

CARLISLE.—For erecting a warehouse, Victoria Viaduct, Carlisle. Mr. J. H. Martindale, architect, Viaduct Chambers, Carlisle. Quantities by the architect:—

Section No. 1.

J. and R. Bell	£2,076 12 6	Beaty Bros.	£1,597 0 0
B. Little	1,931 15 0	W. and H. David-	
Jas. Beatty	1,841 15 0	son*	1,389 13 10
J. Laing	1,681 0 0	[All of Carlisle.]	

*Accepted.

CHURCH (Lancs.).—For the erection of street works paving, &c., Blackburn-road, for the Urban District Council. Mr. W. E. Wood, Surveyor, Council's Offices, Church. Quantities by surveyor:—

Chadwick Bros.	£1,229 14 4	Executors of A.	
John Moore	1,083 3 9	Broadley	£983 18 1
W. H. Bury	1,083 10 9	Thomas Horrocks	972 4 4
George Adams, Os-		A. Lord (flagging	
waldtwistle*	998 2 11	only)	81 6 0

*Accepted.

CORK.—For dining halls, Cork Asylum. Messrs. W. H. Hill and Sons, architects, 28, South Mall, Cork:—
Patrick Murphy, Cork ... £2,097

DEVONPORT.—For alterations and additions to the "Royal Naval Arms," public-house, Devonport, for Mrs. Bosworthick. Mr. Edgar M. Leest, architect, 109, Fore-street, Devonport. Quantities by Mr. James Harvey, Courtenay-street, Plymouth:—

J. Good and Co. (Plymouth)	£1,689 0
J. H. Blackell (Plymouth)	1,497 0
J. H. Gregory (Devonport)	1,470 0
G. H. Smith and Sons (Devonport)	1,320 15
W. E. Blake (Plymouth)	1,249 0
J. Healy (Devonport)	1,160 12
S. Perkins (Devonport)	1,149 17
Jillard and Stevenson (Plymouth)	1,050 0

DEWSBURY.—For the erection of five shops and offices, New Bridge-street. Messrs. Holton and Fox, architects, Westgate, Dewsbury:—

Masonry—Wm. Scott and Sons, Dewsbury	£245 0
Joinery—Geo. G. Smith, Batley Carr	270 0
Plumbing—F. Newsome, Dewsbury	110 0
Slating—W. H. Thompson, Batley	53 0
Plastering—F. Richardson, Dewsbury	36 10
Ironwork—C. Bailey, Dewsbury	26 5
Total	£1,443 15

EALING.—For heating St. Saviour's New Church, Ealing. Mr. Geo. H. Fellowes Prynn, F.R.I.B.A., architect, 6, Queen Anne's Gate, Westminster, S.W.:—

Hadden and Sons, King's Cross	£585 8
John Grundy, London	467 0

Hot Air.

HANSLOPE.—For additions to schools. Mr. W. Hull, architect, 12, St. Giles-street, Northampton. Quantities by architect:—

W. Whitbread	£1,188	Fathers	£1,119
Woodford & Smith	1,125	Branson and Son	1,116
H. Martin, Northamp-		Slaymaker and Harlow	1,086
ton*	1,120	Wilson and Alright	950

*Accepted, subject to the approval of the Education Department.

LONDON.—For the erection of boundary walls and fences to the Whalebone-lane School site, for the West Ham School Board. Mr. William Jacques, Architect to the Board, 2, Fen-court, E.C. Quantities by Messrs. R. L. Curtis and Son:—

Battley, Son, and	£1,733 0	Gregar and Son	£1,397 0
Holness	1,705 12	Hosking	1,383 0
Noakes	1,570 0	Hearle and Farrow	1,383 0
Maddison	1,550 0	Fulcher	1,356 14
Sharpe	1,550 0	Reed and Son*	1,336 0

*Accepted, subject to the approval of the Education Department.

LONDON.—For new Receiving Wards at the Strand Workhouse, Silver-street, Upper Edmonton, for the Guardians of the Strand Union. Messrs. W. S. Cross and Kekwick, architect, 18, Outer Temple, Strand. Quantities by Mr. Bernard Swinstead:—

J. Jarvis and Sons	£2,598	H. Wall and Co.	£7,460
C. G. Hill	8,000	T. G. Sharphington	7,448
W. Lawrence	7,953	Merredew and Wort	6,335

LONDON.—For the partial reconstruction of the North-Eastern Hospital (Metropolitan Asylums Board). Messrs. A. and C. Harston, architects:—

Martin, Wells, & Co.	£139,725	Spencer, Santo, and	
Leslie and Co., Ltd.	121,145	Co., Ltd.	£114,975
W. Johnson and Co.,		McCormick & Sons	
Ltd.	118,349	Northampton-st., N.*	113,641

*Accepted.

LONDON.—For paving works in certain streets, Bethnal Green improvement scheme, for the London County Council:—

Bradshaw & Co.	£7,653 3 3	Val de Travers	
Brunswick Rock		Asphalte Pav-	
Asphalte Pav-		ing Co. Lim.	£8,961 6 6
ing Co.	7,550 5 9	W. Griffiths	6,738 16 5
W. Wadey	7,344 7 1	Trinidad Lake	
		Asphalte Co.	6,359 7

LONDON.—For sewerage, levelling, and ballasting new roads on the Fortis Green Estate. George H. Paine, architect:—

R. Jackson	£2,888	T. Adams	£2,494
C. W. Killingback and		W. Wadey	2,395
Co.	2,709	Williamson and Son	2,340
J. A. Dunmore	2,544	R. Ballard, Ltd.*	1,897

*Recommended for acceptance.

LONDON.—For alterations and additions to the "Cotten-ham Arms" public-house, Upper Holloway, for Mr. J. E. Sutton. Mr. A. E. Pridmore, architect, 2, Broad-street-buildings:—

Stevens Bros.	£2,055	Marchant and Hurst	£1,839
Lyle and Co.	1,970	King	1,790
Ditcham and Taylor	1,861	Thompson	1,773

LONDON.—For the erection of a cold storage warehouse, for the Imperial Lager Brewery Company, Limited, Tottenham. Mr. A. Paul MacAlister, architect. Quantities by Mr. E. Dermot Nixon, both of 9, Gray's Inn-square, W.C.:—

Coulson and Lofts	£15,485	Sindall	£13,416
A. Porter	14,243	Dove Bros.	12,845
Patman & Fothering-			
ham	13,451		

LONDON.—For erecting new premises on the sites of No. 2, Hansell-street, and 19, Jewin-street, E.C. Mr. Delissa Joseph, architect, 17 and 18, Basinghall-street, E.C.:—

Shillitoe and Sons	£5,000	Perry and Co.	£4,339
H. Lovatt	4,844	Allen and Sons	4,292
Brown, Son and Blom-		Bywaters and Sons	3,990
field	4,660	Mark Patrick & Sons*	3,964

*Accepted.

LONDON.—For decorative, heating, and sanitary works and general repairs at 26, Park-crescent, W. Mr. Delissa Joseph, architect, 17 and 18, Basinghall-street, E.C.:—

General	Contract	Extras
Vare Brothers	£2,415	£230 4
W. Callingham	2,498	270 0
Bywaters and Sons	2,445	594 0
Maple and Co., Ltd.	2,208	273 0
H. Hanks (accepted)	2,092	145 0

LONDON.—For alterations, additions, and fitting at the "Britannia" public-house, Church-road, Barkin, E., for Mr. W. G. Kitson. Mr. Fred. A. Ashton, architect, 177, Romford-road, Stratford, E.:—

Alterations, &c.	Fittings	Totals
H. Wall and Co.	£3,130	£1,120
J. and H. Cocks	3,082	1,098
A. E. Symes	3,006	1,069
W. G. Maddison*	2,914	1,075

*Accepted.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

GAS-WORKS MACHINERY.

By EDWARD ALFRED HARMAN, C.E.,
Gas Engineer to the Huddersfield Corporation.

INTRODUCTION.

GAS-WORKS machinery is in many respects so closely connected to several branches of engineering, as to make it somewhat difficult to distinguish it separately. The more prominent parts of the machinery have been made the subject of many valuable papers read before this society. This alone renders the idea of producing anything new upon the subject almost beside the question. It is not only the latest idea which is worthy of consideration, but older and well-tested systems. By careful consideration of these, improvements are effected which add materially to their efficiency and life. It has often been realised that by concentrated thought, designs which seemed incapable of improvement have yielded to the touch of ingenuity and adaptation. Under existing conditions of carbonising coal, many escapes of gas—such as are involved with the lifting of the purifier covers, and from open catch purifiers in connection with sulphate and other plants—are entirely unpreventable, while the smoke and steam add to the deteriorating influences. There is also a quantity of purifying material about the works, a portion of which is exposed to the atmosphere for the purposes of revivification. In addition there is a quantity of waste lime and other material frequently in course of removal. The unloading of coal, and the screening and loading of coke, also circulates a large quantity of dust and grit. An eminent chemist one day, in passing through a gas-works with the author, commented upon the objectionable odour he detected, and said he did not mind an equationable one. It is the inequationable gases that have their influence upon the machinery, as well as the others. Lime purification, and especially where the sulphur compounds in the gas are closely dealt with, necessitates the unloading of many thousands of tons of quicklime in the works, the fine dust from which is freely distributed. Gas-works machinery has to deal with numerous combinations of unpurified gases, acids, alkalies, gritty and impure water, oils and spirits. Some of the machinery is required to draw out hot coke from benches of ovens at a distance of from 3ft. to 4ft. from them; while the machines are subjected to all the influences of heat from the furnaces and material they are employed upon. The machinery, therefore, is not working under the same conditions as at other engineering works, where most of the influences named are absent. To meet these special requirements, necessity and experience have designed a whole collection of machinery, which possesses distinct features of interest and importance.

OBJECTS OF GAS-WORKS MACHINERY.

The extension of gas-works machinery is not merely an effort to "save another man," or to reduce working expenses. Apart altogether from the delights and fascination of invention, there is, or should be, the additional object of alleviating the more arduous and irksome work of those engaged. The lot of gas workers has been greatly improved by the adoption of machinery. Machinery reduces the actual unskilled labour on the works; but the manufacture and maintenance of it considerably increases the demand for skilled labour, which in itself is a great counterbalancing consideration for the labour market. The very existence of gas-works depends upon the advance and improvements made from time to time in its machinery and plant.

CARBONISATION.

Mr. John Brunton, a predecessor of the author's at one of the Birmingham gas-works some sixty years since, experimented with an ingenious process, which he patented, for continuous carbonisation. The bottom of the

retort was placed at an incline, and was possibly the precursor of the subsequent inclined retort systems. The coal was propelled in from one end in small charges, the resultant coke dropping out into a watertrough at the other. This system has been tried since at various works, under different names, but has not been permanently successful. The most recent attempt of continuous carbonisation is that known as the Yeadon revolving gas retort.

OPINIONS OF RETORT HOUSE WORK.

Gas-works operations are frequently considered as the most exhaustive class of labour. Retort house work is spoken of as though it were considerably harder in every particular than puddling furnaces. If a comparison could be drawn between the operations of match-making, phosphorous, chemical works, copper works, mill work, and gas-works operations, a different idea would at once prevail.

NOVELTIES.

Nearly every gas-works possesses novelties and ingenuities in machinery which will well repay examination. In many cases they consist principally of special adaptations to peculiar circumstances. At all events, one frequently learns from them what to avoid as well as what to adopt.

MAGNITUDE OF OPERATIONS.

Gas manufacture is often considered as a purely chemical operation, which, although largely true, does not altogether exhaust the subject. To illustrate the magnitude of the machinery required, a few figures bearing upon the subject will suffice. According to the Parliamentary returns of authorised gas undertakings in the United Kingdom, upwards of 12½ millions of tons of coal are carbonised annually; this produces eight million tons of coke, together with two million tons of tar and ammoniacal liquor, and 130,000 tons of sulphate of ammonia; while for the quenching of the coke three million tons of water have to be obtained and distributed. It is not simply the carbonising stages which have to be dealt with, but also the subsequent treatment of the various residuals and bye-products.

DEVELOPMENT OF GAS-WORKS MACHINERY.

While large gas-works are frequently found to be well equipped with machinery, there are many medium-sized and small works existing in which much remains to be done. At a not very remote date gas-works machinery was of the most meagre character; thanks, however, to the enterprise and ingenuity of members of this and kindred engineering societies, such rapid improvements and developments have been effected, that many large gas-works have machinery of considerable magnitude and importance. It is to the further employment and adaptation of machinery for all available purposes that gas undertakings have to look in the future for the extension of their operations. It necessarily follows that with such machinery in use, all kinds of lathes, shaping machines, and tools are required for their proper maintenance. Indeed, the author ventures to think that some of those engaged in what may be termed purely engineering works would be surprised to find the extent to which machinery is required and employed in gas-works.

FUTURE OF GAS-WORKS MACHINERY.

The rapid extension of carburetted water-gas plants (the gas from which can only be used sparingly), oil-gas plants, and the inclined retort system necessarily minimises the quantity of machinery required in gas-works; but whether these systems will continue to reduce the quantity remains to be seen, and can only be a matter of speculation.

EXHAUSTING PLANT.

The central, and most important parts of gas-works machinery are the exhausters, although they act in the capacity of pressure pumps as well. In the majority of works, the ascension pipes leading from the retorts have arch pipes at the top, which dip into a hydraulic main. In some few works, the dip pipes have been abolished, and a dry main substituted. In connection with the subject of exhausters it

may be of passing interest to deal with a common fallacy respecting the function of this little understood portion of the machinery. It is not infrequently supposed that it is the duty of the exhausters to draw away gas from the retorts; whereas the object is purely to reduce the seal upon the dip pipes themselves, and to draw away the gas from the hydraulic main alone, thus leaving room for the newly evolved gas to take its place. As an example of this reduction of seal, suppose a hydraulic main to have a dip pipe sealing to the extent of 3in. Upon the exhausters commencing duty on 2in. vacuum, the liquor in the hydraulic main is at once raised, whereas that in the dip pipe is depressed to but 1in. seal, and through this seal the gas bubbles as it is made, practically forcing its passage. It is absolutely necessary that the dip pipe should be always sealed, as if it becomes unsealed, the vacuum is at once put on the ascension pipes; and supposing the retort lid were open, this would admit of air being drawn up, composed by volume of eighty per cent. of a diluent gas—nitrogen. This would deteriorate the gas to an alarming extent, apart altogether from the danger of forming an explosive mixture. Not only so, but the unsealed pipe would prevent the other pipes in the retort bench having their seal proportionately reduced, hence they would receive undue back pressure, and commence blowing at the joints of the retort lids, &c. Heavy back pressure on the retort produces deposition of carbon on the sides of the retort. This is a heavy, hard, solid, stone-like substance, requiring to be either chipped off with strong bars, or consumed away by leaving the lids open, or by any other specially provided means. The deposition of carbon to the extent of 1in. upon the interior of the retort would seriously affect the heats and the fuel account. In the early days of gas making, exhausters were not used, the gasholders having to be counterbalanced by heavy weights, but the carbon nuisance became so great as to ultimately lead to the adoption of exhausters. Another evil of heavy back pressure is that the issuing gas, being unable to get away rapidly enough, is detained in the retort with the incandescent coke, and thereby becomes seriously decomposed. It is a common supposition that atmospheric air is deliberately drawn into the gas at the retorts through the exhausters. To assist purification at a later stage, it is sometimes found an advantage to admit a measured percentage of air, in order to utilise the 20 per cent. of oxygen (by volume) therein, for assisting the revivification of the oxide of iron in the purifiers, but on account of the deleterious effect of the nitrogen, it has to be used with the greatest possible care. In my works at Huddersfield, in preference to this, an extensive oxygen making plant is used, constructed under Brin's patents, and possessing many features of interest and importance. Supposing the dip pipes became unsealed when the retort lids were shut, the vacuum would be then upon the retorts direct, and as in the process of time these have cracks in them, the result of such vacuum would obviously be to draw the obnoxious furnace gases from the setting through the cracks, and hence into the gas mains. The producer gas contains usually about 24 per cent. of carbon monoxide, and 8 per cent. of carbonic acid gas, while the spent gases, which would probably be those to be drawn in, consist almost wholly of carbonic acid and nitrogen. Apart from the non-luminosity of such gas, the purification required to eliminate it would be disastrous to working expenses. In gas-works where the hydraulic main has been superseded by a dry main, a slight back pressure is also necessary on the retorts, or all the serious consequences mentioned would be liable to take place. Apart altogether from these consequences, anything like putting a vacuum upon the ascension pipes would have the inevitable result of drawing up small particles of coal dust and coke, and stopping them up with a hard, tarry substance. A further function of the exhauster is to force the gas which has been distilled in the retorts through the purifying and other apparatus of the works, and ultimately to raise the gasholders.

(To be continued.)

* A paper read before the Society of Engineers, on June 6th, 1898.

Builders' Notes.

A SINGULAR accident, resulting in injury to four workmen, occurred on the Great Western Railway at Carey Bridge, near Ross, Herefordshire. The bridge was under repair, and a crane used for raising girders, from some unexplained cause, fell over into the river Wye. The chain of the crane, flying back, smashed the woodwork of the bridge and injured four of the workmen.

SOME buildings forming part of the foundry of Messrs. Beaver and Dorling, Dewsbury, recently collapsed. The foundry lies between Northgate, Foundry Street, and Corporation Street, the last named a new thoroughfare in which a number of shops are to be erected on the north side. Mr. Scott, contractor, had men employed in getting out the earthwork for cellaring, and it is feared that the foundations of part of the foundry premises, which are very old, have been undermined. The workmen, alarmed by some timber cracking, got clear away, and no one was hurt.

THE great mill chimney at Grange, Mytholmroyd, has just been razed to the ground. Mr. Joseph Smith, the Lancashire steeplejack, had the work in hand. The chimney was about 60yds. high, and was estimated to weigh close on 2000 tons; it measured 11ft. square at the base, and was built in 1833. It had the most massive foundations of any chimney which Mr. Smith has ever tackled, and the workmen engaged upon the job have experienced no little difficulty in removing the stonework at the base. The walling of the chimney was 4ft. thick, and the lime which was used in its construction had set almost as hard as the stone itself. The method of demolition was as follows: Two-thirds of the circumference of the base was removed, bit by bit, and stout props of timber were inserted in place of the stone; the masonry taken out of the chimney was made into a sort of fireplace at the base; a bonfire of wood shavings, solid pitch, and a ton of the best and most inflammable coal was built close up to the wood props, and the whole was then saturated with a couple of barrels of paraffin and a torch applied. A huge crash soon afterwards announced the downfall of the chimney to anyone within a considerable distance, the stack falling ten minutes after the fire was lit.

It has long been recognised that Waterloo Station, alike in the interests of the public and of the South-Western Railway Company, must, sooner or later, be greatly enlarged. A few months ago there seemed every reason to believe that active steps towards the accomplishment of the improvement would not be delayed beyond the present year. The railway company had applied to Parliament for compulsory powers to acquire the land necessary for the much-needed improvement, and the House of Lords had favoured the scheme with its imprimatur. Unfortunately, the Company discovered afterwards that they had asked for and obtained more than they could, from a financial point of view, satisfactorily deal with. They, therefore, proceeded to cut down their plans in order to save some portion of the enormous expense which they found, as a result of preliminary investigations, would be involved in carrying out their original design of extending the boundaries of the terminus to Waterloo Road on the west, and to the southern side of Lower Marsh on the north. When the question came before a Select Committee of the House of Commons the other day, Mr. Pope, Q.C., opposed the modified scheme on the ground that it did not secure those improvements in regard to the public thoroughfares of the district which had led the County Council of London to let the former proposals pass without resistance. The Chairman of the Committee on the conclusion of the evidence and arguments intimated that the scheme was rejected, not only because it was not the same as the House of Lords had approved, but because it was in itself ill-considered and unsatisfactory.

Surveying and Sanitary Notes.

ONE of our Academicians, Mr. John William North, A.R.A., has been lately suffering in a twofold manner from the inefficiency of our law with regard to negligence, and also from taking a house without previously having sufficient information respecting its sanitary fitness. Illness had arisen from defective drains, not only on the premises themselves, but on those of his neighbours. However, his only remedy has been the foregoing of a year's rent, and having to pay his own costs, for the judge intimated very early in the case that the law was not on the side of the sufferer.

THE freehold of Nos. 175, 177, 179, and 181, Oxford Street, has been disposed of at the City Auction Mart by Messrs. Debenham, Tewson, Farmer, and Bridgewater. The property has a frontage of upwards of 68ft. to Oxford Street, covers a ground area of 7611 square feet, and is stated to be in the occupation of Messrs. S. J. Waring and Son, Limited, upholsterers, at a rental of £2120 per annum. The biddings started at £35,000, and were raised to £52,550, at which price the property was sold.

WE confess we do not understand why the London County Council exhibits such a sublime neglect of the stench which have of late made the Embankment abominable. They are, of course, worst in summer; but they are no new thing, and no light matter. They result undoubtedly from the jets of foulness forced up out of the gratings which ventilate the great low-level sewer. We are aware that that sewer is overworked. But we cannot believe that the resources of chemistry and engineering cannot provide any plan for sweetening the air. Surely there are not a few oxygen-producing patents which profess at least to deodorize, if not to purify, such outlets. We do not gather that any plan is even tried. The evil is gross, and has gone on for an intolerable while.

COMMERCIALLY useless and aesthetically hideous, the stretch of the Thames which extends upwards from Putney Bridge cries aloud for improvement, and some experts and representatives of the London County Council sailed up the river in a launch one day last week to examine the proposed site for a new lock. At first it was suggested that the additional dam, which is to keep the muddy foreshores of the higher stream covered at all states of the tide, should extend from a point almost opposite the outfall of the Wandale to the Middlesex shore near the Putney Railway Bridge. A second and better scheme puts the new lock in Battersea Reach, just below Wandsworth Bridge. Here the river is narrower, while the depth of the water is greater; and at a cost of some £230,000 it is calculated that within four years a lock could be made which would immensely assist navigation, and redeem the Royal river from the appearance of a marshy creek when the sea is out. The inspection was, in fact, convincing as to the necessities of an improvement, which ought to have been undertaken long ago.

A CONFERENCE convened by the Bermondsey Vestry has been held at Bermondsey for the consideration of the question of overcrowding and the housing of the working classes. As the result of a very lengthy discussion, in which it was contended that the mere enforcement of the by-laws with respect to houses let in lodgings, or the provision of cheap railway fares, would not effectually remedy overcrowding, the conference agreed to the following motion: "That the London County Council be asked to exercise their power under part 3 of the Housing of the Working Classes Act to provide accommodation within the County of London where required." The conference also passed a resolution calling upon the London County Council "to insert a clause in their General Powers Bill of 1899 to

enable Metropolitan Vestries and district boards to erect municipal dwellings under part 3 of the Housing of the Working Classes Act 1890." Other resolutions agreed to expressed the opinion that the London County Council ought to contribute to the cost of the dwellings erected by the local authorities, that the management and retention of such dwellings should be permanently vested in the local authority, and that in view of the heavy cost of land in London the local authorities should not be compelled to repay the cost of such land out of the income from the dwellings, and that the period for borrowing for buildings should be extended to 100 years.

MUNICIPAL improvements in Cuba will give much work in the future to engineers, says the *Engineering Magazine*. First among these is the drainage of the towns. The sewers, where they exist, are horrible things, built without the most elementary knowledge, in which the congested filth of years breeds disease and vile odours. Means of flushing them do not exist, and undoubtedly the more apparently filthy system of dumping house refuse and emptying substitutes for waterclosets along the kerbstone is less dangerous to health than such a sewerage system. To this abominable condition of the towns may be traced the prevalence of fevers, smallpox, and dysentery in Cuba. These diseases are uncommon in the isolated estates, and may be almost entirely eliminated from the island by giving attention in the towns to the most ordinary rules of sanitation. Another and equally important necessity in Cuban towns is water. Havana is pretty well supplied, but in most other towns there is very little or none beside the rainwater stored during the wet season in great stone cisterns beneath the houses. It is not that the people in general do not fully appreciate the necessity and luxury of water, but that the executive power is lacking. Taxes are raised for this purpose, and special taxes are sometimes levied to build new works or for coal to keep the pump going, but (and this may serve as instance of many transactions) the money is calmly banked to the credit of the officials, or the coal is bought and resold for their benefit. Water is wanted terribly in the towns during the dry season, and may easily be had. Excellent springs abound in most places, and small rivers of good water are fairly common.

AT last the governing authorities of Stonehouse seem to have overcome the difficulties which have arisen from time to time in connection with the provision of an ample supply of pure water to the township, and a scheme has been completed by which a continuous and an abundant service will be assured. In 1893 Stonehouse went to Parliament with a Bill of their own, and there they met both Devonport and Plymouth, each bent on the same errand. In the end Plymouth offered such advantageous terms to the township that the then Local Board ceased all further action in connection with their Bill. The offer was to supply 1,000,000 gallons of water a week for the first two years at 2½d. per thousand gallons, and 1,750,000 gallons per week at the same price for the next three years. This latter period has just expired, and it was originally arranged to inaugurate on that day a larger service of 500,000 gallons a day at 2½d. per 1000 gallons for sixty years, and afterwards 1d. per 1000 gallons in perpetuity, but unforeseen circumstances necessitated a postponement of the function. In addition to the foregoing arrangement, Stonehouse bought up Devonport's rights to supply water to the township, the price paid being £11,750; and the District Council also came to an arrangement with Plymouth that the Corporation should lay a special 12in. main at its own cost within its own borders, from the top of North Road to Eldad, the agreement being that Stonehouse shall pay something like £200 per annum, to be eventually reduced to £150, for this convenience. The junction of the main occurs at Eldad, and from that point a 12in. main has been carried through the principal streets of the town. In future, therefore, Stonehouse will be sure of a constant supply of excellent water.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

(Continued from page xxix.)

IX.—WINDOWS.

ALTHOUGH there is great diversity in the design and construction of windows, they may for our purpose be classified under five heads, viz.:

(1.) **SASH FRAMES**, in which the sashes slide vertically in a cased frame; this class includes venetian frames, double frames, and two-light frames.

(2.) **CASEMENTS**, in which the sashes are hung on hinges to solid frames.

(3.) **PIVOT FRAMES**; these are solid frames with the lights hung on pivots, either vertically or horizontally, and include hospital frames.

(4.) **SLIDING SASHES**; in these the lights slide horizontally, either between beads or on metal rails, the frames are both solid and cased.

(5.) **SPECIAL FRAMES**; this will include frames coming under one or the other of the above definitions, but varied in arrangement for particular circumstances, such as bay windows, dormers, skylights, lantern lights, and double circular frames.

SASH FRAMES.—This is by far the commonest

A DOUBLE HUNG CASED SASH FRAME.

form of window fitment, and, given sound material and fair workmanship, it fulfils perhaps better than any other kind the requirements of a window, that it shall admit as much light and air as possible, be wind and water tight, and easy of opening and closing; its principal fault being the difficulty of cleaning the outside. Fig. 132 is a vertical section, Fig. 133 inside elevation, Fig. 134 horizontal section of a double hung sash frame, with 1½ in. moulded sashes; other diagrams give details to a larger scale; the reference letters apply to the same pieces throughout. H is the head of frame; O H, outside head lining; I H, inside head lining; C, cill; V, ventilating slip; P, pulley stile; O L, outside lining; I L, inside lining; B L, back lining; P, parting bead; G, guard bead; T, top rail of sash; B, bottom rails; M, meeting rails; S, parting slip; U, lining groove. The method of constructing these frames is as follows:—The oak cill is worked to the section, trenches are cut at each end to receive the pulley stiles at the specified distance apart (which is usually in line with the reveal of the brickwork), into which they are wedged and nailed, the head is grooved to correspond to the cill and nailed on the top ends of the pulley stiles. Then the linings are nailed on each side of the frame; these are grooved on the undersides, as shown in the detail sketches, to receive tongues, worked on the pulley stiles and head of frame, and on the outsides, to receive the jamb linings. It will be noticed that the outside lining overhangs the pulley stile about ¼ in., forming a fence for the top sash to work against, the inside lining is kept flush with the face of the pulley stile, so that the sashes may be got into their places, and afterwards the guard beads are nailed or screwed into position inside. The two sashes are kept apart by the ¼ in. parting beads fitted into grooves in the middle of the pulley stile, forming with the guard beads and the outside linings two paths, in which the sashes move. The back lining is nailed to the back edge of the outside lining, and its other edge fits into a groove in the inside lining; this allows it to shrink without splitting. These linings and the pulley stile form the boxing for the weights, which are separated by a thin strip, hung freely from the head. Access to the weights for the purpose of hanging or rehanging is obtained by the pocket cut in the lower end of the pulley stiles; the hole is covered by the pocket-piece, kept in position by the beads.

FIG. 134. —HORIZONTAL SECTION. A DOUBLE HUNG CASED SASH FRAME.

Two methods of cutting these are shown in Fig. 138, the one at A being preferable, where the pocket is in the middle of the stile, as thus the linings can be nailed throughout the length of the pocket. The ventilating piece shown at V, Fig. 132, is notched between the stiles before the linings are fixed, and the bead stuck on its top edge mitres with the guard beads; the purpose of this piece, as its name implies, is to afford ventilation by permitting of the raising of the bottom sash nearly clear of it, and thus getting a space of equal size between the meeting rails, through which a current of air can pass without down

could be cut at one operation from a 9in. board, and still afford ample room for the weights.

DOUBLE SASH FRAMES are used principally in banks and offices when it is desired to deaden the sound of outside traffic. They consist of two sets of sashes parallel to each

the hanging of the two outside pairs of sashes, and makes the head of the frame do duty for a lintel, discharging arches, of course, being out of the question. Figs. 136-137 illustrate a frame of this description, the two middle sashes being hung, and the outside ones fixed. The cords for the middle sashes are carried over pulleys in the top end of the mullions, across the head of the side openings, to the pulleys in the boxings, which, in this case, have to be kept close up to the head. The cords are concealed by a cover bead, and the top rail of the side sash, which is grooved to receive it. Figs. 138-139 show a cased frame for a large opening. In this all the sashes are hung;

FIG. 137. PLAN OF SOLID MULLION VENETIAN FRAME.

FIG. 135. DOUBLE WINDOWS. VERTICAL SECTION.

draught. The guard beads should always be rebated in, as shown at Fig. 135, to prevent them binding the sash. It often happens that in drawing up specifications of this and similar fittings sufficient attention is not given to the market sizes of stuff, and much trouble and waste of material is caused to the builder without any corresponding advantage to the client; for instance, it may be required that 5in. linings be provided for frames with 1½in. sashes. Now this means that only one lining can be cut from a length of 9in. board, and the piece cut off is probably wasted, whilst if shown as in the drawing, Fig. 134, a pair

other, working in the same frame; which is similar to an ordinary frame, with the exception that the cillhead and pulley stiles are wider than usual. Fig. 135 is a broken vertical section through a double frame.

A sash frame divided into two openings by a mullion is called a two-light frame.

and, to keep the mullions as narrow as possible, one weight is made to do duty for two sashes, accomplished in this manner: A pulley is fixed to the top end of the weight, and the cord is taken around this, over the axle pulleys, to the sashes on each side of the mullion. By this means four weights are made to balance

FIG. 138. SECTIONAL ELEVATION OF CASED VENETIAN.

VENETIAN FRAMES are sash frames divided into three or more openings by mullions, solid or cased, according to the size of the frame. These are great favourites with the suburban speculative builder, as, by their use, he saves

three sashes, in place of six required by the ordinary method. When sashes are hung in this way they must be about equal in size, otherwise the lighter one will be overbalanced. A piece of cork inserted in the sash-stile will, however, counteract this to some extent.

(To be continued.)

FIG. 139. PART PLAN OF CASED VENETIAN.

A PROPOSAL has been made to construct a light railway with a junction at Hurstbourne on the London and South-Western Railway. The line is to proceed through Bourne, Hurstbourne, and Tarrent to Grafton or Bedwyn stations, near Savernake Forest.

Property and Land Sales.

Sale Days for the Year 1898.

MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and Co. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of Freehold, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, July 28.	Thursday, Nov. 10.
Thursday, Sept. 22.	Thursday, Nov. 24.
Thursday, Oct. 13.	Thursday, Dec. 1.
Thursday, Oct. 27.	Thursday, Dec. 15.

Messrs. Farebrother, Ellis, and Co. publish in the advertisement columns of The Times every Saturday a list of their forthcoming Sales by Auction. They a so issue from time to time schedules of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

ABBEY-WOOD.—Freehold Building Land and Leasehold Premises in this popular district, near Woolwich.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and Co. will SELL by AUCTION, at the Mart, London, E.C., on THURSDAY, JULY 28th, 1898, at TWO o'clock precisely, the above-mentioned PROPERTIES, comprising about 23 acres of FREEHOLD LAND adjoining Abbey-wood Station on the North Kent line, possessing a frontage of several hundred feet to the high road, and especially suitable for the erection of manufacturing premises; also a Leasehold Property of about 14 acres, with house and buildings, known as Old Park, Bostall, adjoining the well-known Bostall Heath and Woods.

Particulars of sale may be obtained of Messrs. ROBBINS, BILLING, and Co., Solicitors, Bank-chambers, Nos. 218-221, Strand, W.C.; at the Auction Mart; and of Messrs. FAREBROTHER, ELLIS, and Co., 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

SOLD.—NORTH-FLEET.—Freehold Cottages, known as Nos. 13 to 23 (odd numbers), Gordon-road, near Gravesend. Let at weekly rents amounting to £93 12s. per annum.

MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and Co. beg to announce that this desirable FREEHOLD INVESTMENT WAS DISPOSED OF at their Auction Sale on Thursday last.

No. 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.

Westgate-on-Sea, proverbially one of the healthiest towns on the English coast, 1½ hours' journey from London.—Valuable sites in choice positions, suitable for the erection of marine residences.

MESSRS. ROGERS, CHAPMAN, and THOMAS (in conjunction with Mr. R. Temple) will SELL by AUCTION, at the Station Hotel, Westgate-on-Sea, on WEDNESDAY, AUGUST 31st, 1898, at THREE p.m. precisely, in lots, several PLOTS of LAND, commanding sea views, and others suitable for erection of detached and semi-detached residences of good character; also a few shop plots. Favourable opportunities are offered to gentlemen desirous of building to their own tastes in a select seaside resort, with excellent bathing, pure water, good train service, sheltered gardens, and public promenades. Arrangements can be made for payment by instalments.—Plans, particulars, and conditions of sale of Messrs. FARRER and Co., Solicitors, 66, Lincoln's Inn-fields, W.C.; of Mr. R. Temple, Estate Office, Westgate-on-Sea; and of the AUCTIONEERS, 50, Belgrave-road, South Belgravia, and 78, Gloucester-road, South Kensington.

Longbridge-road Estate, Barking.

Remaining Portion, at low reserves, to close the Estate. **MR. JOHN H. BETHELL** will SELL by AUCTION, at the PUBLIC OFFICES, East-street, Barking, on THURSDAY, JULY 28th, 1898, at 7.30 o'clock in the evening precisely, 115 lots of valuable FREEHOLD BUILDING LAND, including ten shop plots, with frontages to Longbridge-road, Fanshawe-avenue, and Montague-avenue. Possession on payment of a deposit of 10 per cent., balance payable in five years. Free conveyances. The land is free title and land tax. The estate is situated in a good position, adjoining the Public Recreation Ground and Barking Railway Station, from whence there is a good service of trains to the City. The roads are made, sewered, and kerbed, and the subsoil is a deep bed of gravel. There is a large demand for houses, which let and sell very readily.

Particulars, plans, and conditions of sale to be obtained of Messrs. SAVERY and STEVENS, Solicitors, 2, Brabant-court, Philpot-lane, E.C.; or the AUCTIONEER, 31, Liverpool-street, E.C., and Estate Offices, Upton Park, E.

Auction Sales, 1898.

MR. GEORGE BRINSLEY will hold his Monthly AUCTION SALES, at the MART, Tokenhouse-yard, E.C., for the year 1898 on the following days:—

Wednesday, July 20.	Wednesday, Oct. 19.
Wednesday, Aug. 24.	Wednesday, Nov. 16.
Wednesday, Sept. 21.	Wednesday, Dec. 14.

Landed Estates, Town and Suburban Houses, Building Land, Ground Rents, Business Premises, Reversions, Shares, and other Properties for absolute Sale, will be included in these sales on reasonable terms, which can be fixed beforehand if so desired.

Auction and Survey Offices, 30 and 31, New Bridge-street, Ludgate-circus, London, E.C. Established 1852. Telephone Number, 661, Bank. Telegrams, Bridging, London.

CHICAGO EXHIBITION

HIGHEST AWARDS.

ALBION CLAY COMPANY LIMITED.

SOLE MANUFACTURERS of the

"GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "Granitic Stoneware" Pipes are made from "Stoneware" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** purposes. The Pipes have a "**toughness**" as opposed to "**brittleness**," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "**Granitic Stoneware**," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked

All sizes to 24in. diameter of full Standard thickness, and of any length up to 3ft. for 6in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM.

PERSPECTIVE VIEW

LONGITUDINAL SECTION THROUGH C.D.

SECTION THROUGH A.A.

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage** and **Drainage** according to circumstances, the **Patent Paragon Pipes** are made in **three** forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c.; (B) With **deep** Sockets for **Sewers** and **House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying**, the Name should always be given in full, as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious** and **imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made Watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by ordinary Pipe-layers. Bends and junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Water-logged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.

JONES & SYKES' PATENT CHANNEL BENDS FOR MANHOLES AND INSPECTION CHAMBERS.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket to hold Detritus. Cannot untrap.

KEITH'S PATENT DRAIN TESTING AND FLUSHING TRAP. Simple in Construction, efficient and reliable.

SYPHONS, GULLIES, INTERCEPTORS, &c. with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap and fitted with **SYKES' Patent Screw Stoppers**.

INVERT, JUNCTION, and GULLY BLOCKS. STREET GULLIES to any size. **LATRINES, CLOSETS, SINKS, &c.**

Works: **WOODVILLE, BURTON-ON-TRENT.**

CHIEF LONDON OFFICE: **18, NEW BRIDGE STREET, E.C.**

LONDON DEPOT: **MIDLAND RAILWAY (Somers Town Goods Station), OSSULTON STREET, EUSTON ROAD, N.W.**

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

An Architectural Causerie.

Contributions to England's History. THE author of a recently published work on Norton-sub-Hamdon,* in the county of Somerset, has apparently obtained his idea from the Rev. J. Ch. Cox, LL.D., who told us some years ago how a parishioner should set about writing his history, or that of the place he belongs to. At the time his booklet was written a much-needed "County History of Lincolnshire" was being projected on the basis of separate parochial histories, and it appeared to the writer that the material for a complete History of England would quickly be found, if only in each particular case the *genius loci* were made to bestir himself, and the consequence was an opusculum which anticipated all his requirements. Would you know "How to write the history of a parish" you must be provided with this little book in its latest edition; and if to learn rather more than enough about Norton-sub-Hamdon, you may purchase the handsome volume which Mr. Charles Trask has written and published. It will appear to the general reader to be in every respect thoroughly done. A map, we are told, is a *sine qua non*, and a map of the parish there is. "It should be," says the Rev. Charles Cox, "on a scale sufficiently large to mark all field-names, and it would be well if all obsolete names were marked in a different type, while disused footpaths, or bridle-roads, as well as any changes of the physical characteristics, might also be noted." The author has brought the results of considerable studies to bear upon this particular subject. The position of Norton is implied in *sub* Hamdon; and as *don* stands in Celtic for "hill," we are prepared to be told that the British entrenched that same hill, and established themselves upon it. From this point, looking eastward, the Roman town of Ilchester, "on the line of the great fosse road, is conspicuous in its lowly estate." So History, "layer on layer," is here—British, Roman, and Saxon—and the parish, although containing in all but 110 houses, may be thought worth writing about.

The contrast is complete between this and the comparatively stirring account of Coventry, which, under the title of "Life in an Old English Town," Messrs. Sonnenschein publish. The volume contributed by Mary Dormer Harris forms one of a "Social England" series, and we are told that there is in preparation with others a book on "The English Manor," which should be especially interesting. One who is not a Nature-formed historical student, but whose fondness for shapely things of all sorts is incurable, will sometime or other, if only that he may be able to reason in favour of his pleasures and preferences, look to books for the meanings of institutions and things that seem merely praiseworthy at present. The architectural

student, for instance, works backwards through History. He may happen, perhaps, to grow tired of merely loafing about in old places; maybe he would like his beloved to think that he knows a little at least of what he talketh so freely about. The reason is far to seek, but shortly, no longer the slave of pleasure, he asks for just as much knowledge as relates to the things he delights in, and is more than a little grateful to the writer of helpful books. When last we visited Coventry we had not Miss Harris's volume, or anything like it beside us, and there was nothing to do when night fell but wonder "What might be done next?" Our

many grievous exactions, were persistently making money, and the King, when he wanted it, had to beg for it more or less humbly. What had he to give in exchange but a Charter, and what, at the moment, more welcome? "Knowing how far-reaching was the power of the town rulers, how absolute their sway over the action of their fellow-citizens, it is difficult to estimate the importance of the gift of a Charter of Incorporation. Coventry became, in 1345, a free and independent borough, that is to say, that the affairs of the town were henceforward to be managed by the elected officers of the townsfolk, not by the

Vide "SPAIN: ITS PICTURESQUE CITIES AND MONASTERIES."

pleasures being such as they are, we would rather have had this book than Coventry's best cigar. There is nothing, perhaps, more difficult to explain to oneself or others how a township attains its position. In Coventry, as elsewhere, we find the territory divided between the Earl and the Prior, and one of Miss Harris's chapters relates to their squabbles—each holding a court of his own, and resisting the claims of the other. If the town favours one or the other it may gain a little, perhaps, but not until it is rid of them both can we talk of municipal life. While the landlords were quarrelling, the townsmen, in spite of

nominees of the Prior, the Earl of Chester, or except within certain well-defined limits, those of the King." The most valuable chapters of this ample and excellent book are possibly those on "The Prior's Half and Earl's Half;" on "The Corporation and the Guilds;" "The Corporation and the Commonalty" which shows what people may suffer in spite of their nominal freedom for a "Close Corporation" is the most absolute autocracy; on the Lammas or Common lands, and on "The Companies of the Crafts;" for the general reader those on the daily life in the town, and the concluding chapter on Old Coventry.

The Regeneration of Mayfair.

LONDONERS, who have been exiled from town, from one cause or another, during the past ten years or so, and have only just now renewed acquaintance with the metropolis, will find many changes in its once-familiar streets. Whether it be in the City, or north, south, east, or west, the builder has been incessantly at work, and the London of to-day has, for that reason, become an altogether different place. Although no district has entirely escaped this modernising influence, it is to the West End that we must look, after the City, for the greatest changes. It is not always, nor indeed often, that we can find it possible to point to rebuilding operations and to say that everything is satisfactory. Sentimental considerations, as a rule, come in and give regrets for demolished structures on whose sites the new buildings stand, spick and span. Here, however, in the west end of town, in Mayfair, where a whole district has been rebuilt on the south side of Oxford Street, there were no houses of any great historical fame, while high antiquity and art were alike sadly to seek in a neighbourhood which scarce more than a century ago was a waste of open fields or scattered farmsteads. The houses built on these lands were put up in an era when taste was conspicuously absent from Architecture, and when the town houses, even of the wealthy (and this was then a pre-eminently rich and aristocratic quarter), were built with bald and artless elevations. We are not, however, to suppose that it was an enlightened appreciation of art that led to this recent transformation. Had we been obliged to wait for that, we might well have seen those featureless and colourless streets outlasting our time. The real cause of the change that has come over the district may be sought in the fact of its being all comprised within the ring-fence of one great landlord's property. It is no secret that those streets which centre around Grosvenor and Berkeley Squares are the freehold of the Duke of Westminster, whose scheme for rebuilding the whole of this estate is now so well advanced that few portions of it are left as they were. Berkeley Square itself is, perhaps, less changed than its surroundings, part of it lying on the borders of the Grosvenor property, but even here modernity has come to live in that once altogether gloomy place, and Thackeray, who, in *Vanity Fair*, wrote of it as "Great Gaunt Square," would scarce recognise it now. Its near neighbour, Mount Street, has been altogether re-edified, and at the western end of this now fine thoroughfare rises one of the finest modern mansions in London, Lord Windsor's house. Here, where Park Street crosses at right angles, with Park Lane a little distance along, new houses and flats have just been completed, rich in finely-cut brick and stone elevations, while, fronting the Park, stands that curious example of Messrs. Balfour and Turner's unconventional genius, the long low range of Mr. Beit's house that so sorely exercises the critical faculty of the passers-by on the buses. Few leases now remain to fall in on this neighbourhood, and we shall then see the unusual spectacle of a whole residential quarter rebuilt within twenty years or so. There are those who quarrel with the circumstances that give so huge an unearned increment to the landlord, but this one fact remains, that it is only on the great estates such as these and the Portman and Bedford properties that the cry for an ideal metropolis, for the "London Beautiful," is likely ever to be realized.

C. G. H.

Picture Sales at the Academy.

A BAD YEAR.

ARTISTS who are exhibiting this year at Burlington House must find but small satisfaction in consulting the sale catalogues which are spread out on the little tables in the vestibule, for the sales at the present exhibition compare very unfavourably indeed with those of 1897, which was not itself by any means a prosperous year. It is difficult (says the *Westminster Gazette*) to account for this falling off, for a cold, wet early summer like that of the present year is always beneficial to the exchequer of the Royal Academy. When the weather is fine and warm the Londoner at leisure naturally prefers to amuse himself out of doors, reserving chill and rainy days for the Academy and kindred institutions. This year there were many inclement days in May and June, and an unusual number of shillings were therefore paid at the turnstiles of Burlington House. It might well be supposed that the sales of the pictures would bear some relation to the number of the visitors; but this,

UNFORTUNATELY FOR THE ARTISTS,

has not proved to be the case. To the Academy itself the season has been a prosperous one, but the entire amount realised by the sale of pictures up to the 15th of July, by which time the sale season is practically at an end, was only £13,730 18s., against £16,384 15s. in the corresponding period of last year. Yet, curiously enough, though the sales, taken altogether, are disappointing, they show in one department a marked improvement upon 1897. This is in the Water-Colour Room, where seventy-five drawings have been sold for a total sum of £2005 17s., while last year only fifty-six were disposed of for £1282 17s. The prices of the sold pictures in this room range from £3 3s. to £162 15s., the last-mentioned sum having been given for Mr. Archibald Thorburn's drawing, "The Home of the Golden Eagle." Other water-colours which have realised more than a hundred pounds each are Mr. H. M. Rheim's "Quia Multum Amavit" (£110), Mr. Tom Lloyd's "By Misty Stream and Meadow" (£105), and Mr. Alfred Glendenning's "Haymaking," which the Chantrey Trustees have acquired for £157 10s. Turning now to the

OIL PICTURES,

it will be found that in the First Gallery—always a good room for sales—ten works have found purchasers, the amount realised being £1487 5s., compared with £1395 16s. last year. Chief among the pictures sold in the First Gallery are "The City of Newcastle-on-Tyne," by Mr. Niels M. Lund (£315); Mr. La Thangue's "Nightfall" (£300); "Phyllis is My Only Joy," by Mr. Seymour Lucas (£250); and Mr. Sidney Cooper's "A Morning in Autumn" (£250). In the Second Gallery, the sales amount to £1735 2s., against £603 10s. in 1897. Here Mr. Melton Fisher has sold to the Chantrey Trustees for £500 his picture, "In Realms of Fancy." Mr. Godward's "Nymph of the Chase" has gone for £230, Miss Jessie Macgregor's "The Room with the Secret Door" for £210, Mr. Logsdail's "Going to the Procession" for £175, and Madame Henriette Ronner's "Memories and Anticipations" for £150. So far the sales have shown an improvement instead of a depreciation, when compared with those of last year, and it is not until the great Third Gallery is reached that the

SIGNS OF FALLING OFF

become apparent. Here, however, the loss is a serious one. In 1897 the sales in the large room amounted to no less than £4171 15s., this year they are only £1930, and the greater part of this is represented by the price of one picture, Mr. Frank Dicksee's "An Offering," which was disposed of for £1200. The other pictures sold in Gallery 3 are "Charles II. at Whiteladies," by Mr. Ernest Crofts (£400), "The Ash Grove," by Mr. G. D. Leslie (£200), Mr. Ralph Peacock's "Ethel," which has been purchased by the Chantrey Trustees (£105), and a small painting by Mr. Owen Dalziel, "A

Rescue" (£25). In the Fourth Gallery the sales are considerably better than last year, £1289 7s., compared with £989 12s. In this room Mr. Alfred Parson's landscape "The Mooters" (£840) and Mr. C. E. Perugini's "Weary Waiting" (£400) are the chief pictures sold. The sales in the Fifth Gallery show, on the other hand, a deplorable falling off from the 1897 figures. Last year several important canvases in the Fifth Gallery found purchasers, for a total sum of £1762 10s., but now only one picture is sold—only one, that is to say, of those priced for sale in the catalogue. This is "The Magic Mantle" (£100), by Mr. I. L. Gloag. The returns from the Sixth Gallery are more depressing still. Five pictures have been sold, it is true, but they realised between them only £78 3s., while last year's sales amounted to £1933. In Gallery Seven, where Miss Margaret Dicksee's picture, "A Sacrifice of Vanities," has been disposed of for £250, the figures are better than those of 1897—£497 10s. against £254 15s., but in Gallery Eight, where last year pictures to the value of £1359 15s. were sold, the balance is once more

ON THE WRONG SIDE.

The sales this year in the Eighth Gallery amount only to £705 5s., the highest price (£400) having been given for Mr. Joseph Farquharson's "The Weary Waste of Snows." This year at the Academy small pictures have sold much better than last. No fewer than forty of the 208 little canvases shown in the Ninth Gallery—a room which is always devoted to small pictures—have found buyers. The highest-priced picture sold in the Ninth Gallery is an interior by Miss Jessica Haylar, which has been disposed of for £157 10s. The sum total of the sales in this room amounts to £951 8s., compared with £826 16s. last year. In the Tenth Gallery, which is not usually a good room for sales, exhibitors have done very well this year. Nine pictures have found purchasers for a total sum of £1788 5s., compared with seven pictures and £903 15s. in 1897. The sales in the Eleventh Gallery are also good, £840 8s., against only £391 6s. last year.

IN THE SCULPTURE GALLERIES

the sales, which were bad last year, show a further decline. Only seven of the works on sale in the Central Hall and Lecture Room have been disposed of, and two of these were sold for a guinea each, one for three guineas, and one for eight guineas. Mr. Hamo Thornycroft is the only sculptor upon whom fortune has smiled at the Academy this year, his bronze statuette, "The Bather," having been sold for £250. Finally, in the little gallery devoted to works in black and white, seven drawings, at prices ranging from one to eight guineas, have been sold for a total sum of £30 15s. It must, of course, be understood that the figures given above refer only to the official sales at the Academy, and that a certain number of pictures, including some of the most important, are disposed of privately. The only pictures which have been dealt with are those which were sent to Burlington House priced for sale; but these naturally form the large majority of the exhibited works, for the Academy is incomparably the best selling gallery in England. Numbers of artists build their chief hopes on the chance of selling their works at the Academy, and to them the great falling off in the sales is a matter of very serious import.

THE Earl of Dudley has laid the foundation-stone of the new grammar school at Dudley. The institution dates back to Queen Elizabeth, when lands were granted for the purpose of establishing and maintaining it. The new building is to cost £10,000, and will accommodate 150 boys.

AN effort is being made to raise funds for the complete restoration of Great Hampden Church, which dates from the thirteenth century, and contains many antiquarian features of the greatest interest. It is estimated that the work will involve the expenditure of about £2000.

Puerta Real
Monastery of Poblet

SPAIN: Its Picturesque Cities and Monasteries.

IV.—THE MONASTERY OF POBLET.

By F. HAMILTON JACKSON.

THE monastery of Poblet was one of the most powerful and richest of the Cistercian monasteries, and the first established in Catalonia. It was made the burial-place of the Kings of Aragon, and after the union of Aragon with Castile, was used for the same purpose by the Dukes of Cardona. It is placed at the entrance of the fertile valley called La Conca de Barberá, at the foot of a range of hills called by the name of the Poblet Mountains, which stretches towards Vallerclara, in which the River Francoli takes its rise. It is situated upon that river, the buildings being upon one bank, while a great part of the lands which belonged to the monastery are on the other side. The situation is charming, both on account of the pleasant views, the abundant waters (which also include some mineral springs), and the delightful air, which makes it a most healthy place to live in. Indeed, the chalybeate spring called Font de Ferro, distant from the monastery about one kilometer, is now surrounded by numerous so-called chalets, to house those who desire to take the waters and their families, and they are much resorted to in the heats of summer by the Catalonians.

The best way to get to the monastery from Tarragona is to take train to the station Esplugas de Francoli, on the line from Tarragona to Lérida, which joins that from Valls to Barcelona, at the junction of Picamoixons. From Esplugas to Poblet there is a service of carriages in connection with the trains.

The monastery buildings are surrounded by a great wall more than a mile in length, and 15ft. high, in which is but one gateway. From this an avenue of slender trees conducts the

visitor to a little plaza, at the right of which is the chapel of the Virgin of the Rosary, a beautiful little building of late Gothic, passing into Renaissance in the frieze. It was built in 1442 at the cost of Alfonso V. of Aragon, and was commonly known as the Chapel of St. George, but has recently been restored to its original dedication. At the end of the avenue is the Puerta Dorada, the gilded gate, so called because the sheets of copper with which the doorleaves were covered were gilded in 1564 in preparation for the visit of Philip II. It was built under the kings Don Juan II. and Ferdinand the Catholic, and is a large, simply designed work, with machicolations above the gateway, below which are three Royal escutcheons and three of a smaller size, showing the abbot's arms. It was in this spot that royal personages who paid a visit to Poblet were received, and formerly there was a sort of atrium behind it, the walls of which were painted with scenes from the life of the hermit Poblet, and with the subject of Ramón Berenguer granting the monastery to the original monks.

Standing in the Plaza Mayor, to which the Puerta Dorada admits, on the left is a Romanesque chapel, dedicated to St. Catherine, which is one of the three churches which Ramón Berenguer ordered to be built in the year 1150. On the right is a garden, occupying the spot where the pilgrims' guest-house stood; until a few years ago considerable remains existed showing that it was Gothic in style and well proportioned. Just beyond are the small remains of the carpenter's shop, a piece of wall containing a fine pointed window. Here again ruin has befallen the building during the last few years, removing from the interior corbels and other pieces of delicately sculptured stone. At the extreme right, in a prolongation of the plaza, are the ruins of the palace of the abbot—a grandiose and pretentious building of the worst period, containing an enormous number of rooms and galleries, courtyards, gardens, and staircases, connected with the church by a long covered passage also ruined. Around this plaza were grouped the dwellings of the artisans, also the apothecary's and doctor's houses, with the garden of medicinal herbs, the brandy distillery, the wool store, the smithy, &c., and

further back the stables and carthouse, with the dwellings of the field labourers by them.

The wall of the inner cloister bounds one side of the Plaza Mayor, with towers at intervals along it, and with two entrances pierced in it, the entrance to the church, and the Puerta Real, the royal gate, close to which is the staircase to the unfinished royal palace. The church door is surrounded by ornamentation of the period of the decadence, when labour and costly marbles were thrown away upon worthless design. It has above the door a statue of the Virgin in a niche, and on either side niches containing statues of St. Benedict and St. Bernard on a lower level. This doorway gives admission to a sort of atrium, from which the church is entered, called a "Galilea." It is a late addition, and is divided into three vaulted compartments, having chapels at each end. The doorway into the church is the splendid Romanesque one, which has not been meddled with. The plan is a Latin cross, the nave being divided into nave and aisles by a range of seven piers up to the crossing. The transepts are small, and behind the high altar is an apse with seven apsidal chapels, two of which open from the transepts.

The width of the nave is about 27ft., and of the aisles 13ft., making a width from wall to wall of about 66ft., for the piers are nearly 6ft. 6in. thick. The length, including crossing and apse, is about 260ft., and the height of the aisles 55ft., and of the nave 90ft. It was constructed at the very beginning of the reign of the Pointed style, and was a long time in building, so that the style up to the height of the imposts is Romanesque, while above that level the influence of the new ideas begins to be felt, and the rest of the work is definitely Gothic.

The retablo of the high altar is a work of the Renaissance, sculptured in alabaster with great delicacy. It consists of four rows of niches separated by ornamental friezes, while between the niches are pilasters with arabesques. The lowest row contains subjects in relief from the life of Our Lord and His Passion, which also run through the third. The central niche of the second row, which is so much larger than the others that it breaks through the frieze, contains a group of the Virgin and Child; the

other six are empty, the figures which tenanted them having been taken to Belgium in 1839 by General Van Halen; so the people of the place say. In the centre of the fourth story is an Ascension, on each side of which are three pairs of coupled arches containing statues of the Apostles, two of which are missing. Above all is a crucifix and a cornice, very richly and delicately worked with arabesques and figures of children, which ornament also runs down the sides, forming a sort of filling between the architectural framing and the walls. There are eighteen chapels in the church, which are only arranged on one side of the nave; the other being considered to be too near the cloister. The choir occupied the middle of the nave, an arrangement common in Spain but unusual elsewhere. The elaborately carved seats, as well as the organ which it contained, were unfortunately destroyed by a fire. The gate to it was made in 1584.

The other entrance from the Plaza Mayor, the Puerta Real, was the direct way to the principal cloister, which lay close to the church on the north side. It is defended by two octagonal battlemented towers with machicolations around their summits, which were also repeated above the gateway. Its walls are decorated with the arms of Aragon and Catalonia. It was constructed between 1367 and 1377, Pedro IV. of Aragon bearing the greater part of the cost. At the same time the wall which encloses the internal cloister was built, that monarch desiring to convert the monastery into a real fortress which would be safe from external attack. This wall is over 6ft. thick, 36ft. high, and about 620yds. long. The way in which the king contributed to the work was by allowing the monks of Poblet to spend upon the fortification of their own monastery the contribution which was due from them towards the general fortification of his dominions, and at first the walls did not rise with the desired rapidity, because the officials of Lérida, Montblanch, and Cervera, from whose subventions the contribution of Poblet was deducted, put obstacles in the way; but in 1374, fearing that the invasion of Aragon might extend to Catalonia, the king published an order commanding all his vassals, without distinction of class, to work at the fortifications of Poblet until it was completed, the monastery contributing tools and the maintenance of the workmen. After this the king feared that the number of refugees might be so great as to disturb the atmosphere of quiet so desirable in a convent, now that it was a place of security, and he published another order in 1382, by which he limited the number of the suite of such nobles as might wish to stay there, fixing that of members of the Royal family at twenty persons, while counts might have fifteen persons in their train; viscounts, barons, and other nobles but ten. Don Juan II., writing to the Abbot D. Miguel Delgado in the middle of the fifteenth century, specially charged him to look well to his walls, saying that after Tarragona and Lérida there was no fortress in Catalonia which he valued so highly.

From the Puerta Real one enters the principal cloister by a vaulted passage ending in a Romanesque doorway. It is longer than it is broad, the sides parallel to the church having nine arches, while the other two have but eight. The side next to the church is Romanesque in style, and so is the lavatory, which projects from the opposite ambulatory, called the Romanesque "templete;" but the other sides are of fine pointed work, with well-moulded arches and traceries. The lavatory is hexagonal in plan, having in the centre a fountain of stone, from which the water spouted through thirty-one pipes in the time of the monks. Each side is pierced by coupled arches under a larger one—all circular. The capitals are plain and the mouldings simple. The pillars at the angle support a sort of parapet wall, which is supported also by simple corbels. The outer arches of the Romanesque side of the cloister are slightly pointed, the smaller ones being circular, and resting upon coupled shafts and well-carved capitals. On the other sides the head of each arch is filled with tracery, the lower part consisting of

pointed and cusped arches, varying in number from two to four, which rest upon shafts with beautifully carved caps. The vaulting ribs spring from clustered columns. There was formerly another story to this cloister, which was probably of wood, except for the arches at the angles, some of which still exist.

Around the cloister were grouped the various most important dependencies, such as the refectory, library, chapter-house, &c. The first is entered from the first door on the left in the ambulatory to which the Puerta Real conducts. It faces the entrance to the lavatory, and is a vaulted chamber about 35ft. broad by a little over 100ft. long. It is lighted by twelve tall and narrow windows, and is vaulted in four spans. On the right is a pulpit and staircase of hewn stone affixed to the wall, from which it was the custom to read edifying books during a meal to occupy the thoughts and promote digestion. In the further part of the room are the remains of a sort of fountain used for cooling fruit and drinks during the repast. Attached to the refectory are the kitchen (with a hole in the wall where the servery was), storehouses for provisions, &c. Next came a room which was used as a shaving and warming place, formerly vaulted, but now showing but few architectural remains. A little beyond, turning round towards the church, is the magnificent chapter-house. It is a square room, about 48ft. across, and is very fine in its proportions, and well constructed; four slender columns, from which the vaulting ribs spring divide the roof into nine bays, which receive light through five beautiful Romanesque windows—columns, capitals, and corbels all beautifully carved. Around the walls are the remains of three steps, upon which wooden seats were placed. The walls were formerly decorated with portraits of Poblet monks who had been made cardinals or prelates. In the floor are the carved sepulchral slabs of several abbots, many of whom have been buried in this place.

Between the refectory and the chapter-house a door, which bears the arms of Don Pedro of Aragon, gives admittance to a vaulted passage which served as a talking place for the younger monks, and from which the library opened. This building consisted of two rooms, called the ancient and modern libraries. The first of these is 82ft. long by 32ft. broad, and was also known as the Library of D. Pedro of Aragon, because it contained at first his splendid gift of 4322 volumes, precious either from their antiquity or their merit. The other room is nearly the same size, and contained 6500 volumes, which had belonged to dead and gone monks. Their loss is not so much to be deplored as that of the older books, among which were an eleventh century illuminated Bible, a chronicle of King Henry IV. of Castile, and some interesting manuscripts of the fifteenth century. The two libraries are vaulted, and are lighted by high windows. Above them and the chapter-house is a great room 94ft. long, which served as the Novices' Dormitory. Nineteen arches thrown across the room sustain the roof, and from the end nearest to the church a broad staircase descends into the north transept.

There was a corridor a little more than 12ft. wide down the centre, from which the cells were entered, which were square, 3yds. to each side. At the side of the dormitory, above the chapter-house, was the "Archivo" (record office), in which was deposited an enormous number of documents, for the monastery enjoyed the prerogatives and rights of a public notary, given it by Don Pedro of Aragon. There are still preserved in the Academy of History at Tarragona more than 20,000 of these documents, though many have been lost.

(To be continued.)

THE church of Crawley was struck by lightning last week. The lightning was communicated from the conductor to a stove. A terrific explosion followed, and a ball of fire appeared to travel from the north to the south aisle. Beyond two broken windows no harm was done.

IN THE HARTZ DISTRICT.

By G. A. T. MIDDLETON, A.R.I.B.A.

III.—BRUNSWICK.

ONE day only was devoted to Hanover—just long enough to skim the cream, though doubtless much more of interest could have been found had the stay been longer. Brunswick, the next place visited, proved to be of a different character entirely, for although the new buildings are even more handsome, especially one surmounted by a fine "quadri-za" group, they are in a minority, and the interest centres much more amongst the old work. The only architectural lesson is that of the employment of detached brass angle staves to the corners of the staircase, and wherever heavy luggage is likely to be carried past.

As is the case in most large towns, it is the cathedral, amongst the old buildings, which first attracts attention, even if, as at Brunswick, it is not really the best thing there. Still, it is notable, particularly the interior—solemn, simple Romanesque, with the chancel and transepts raised very much above the level of the nave to allow of a crypt underneath on the nave level. This raised portion is now used for Communion services—we should say as a morning chapel—the principal Communion table and the pulpit being west of the crossing with a great suspended rood above to act as a screen, while a flight of stairs rises on either side of the reredos. The effect is very fine indeed, being greatly assisted by the rich colouring which covers everything, walls and columns and vaults, in generally well-designed ornament. If there were not other notable examples to show it, this would be sufficient to prove that a church of severe and simple outline needs flat colour decoration, lavishly employed, to bring out its full beauty. Here at Brunswick the effect from the west end is heightened by a great broad brass ring being suspended in the middle of the nave, of nearly its full width in diameter, as a gasalier.

Like the cathedral, all the other churches appear to have originated in Romanesque times, and to have had two square or octagonal Western towers, connected at a low level by a narrow, high-pitched, span roof, such as still exists in the Martini Kirche, the towers themselves being conical roofed; but in several examples, including the cathedral, the space thus left between the upper parts of the towers has been filled about the fourteenth century with a richly traceried belfry, usually having its roof spanning in the opposite direction, having a gable to east and west. The Martini Kirche has little left, except its towers, of the original Romanesque, but the capitals of the north doorway are noticeable from their extremely Byzantine feeling.

Most of the churches date to the fourteenth or fifteenth century, the nave and aisles being of the same height, and the aisles looped with a gable to each bay—a characteristic of every church in Brunswick. In the Martini Kirche these gables occur even to the chapels round the apse, and as they are filled with elaborate blind tracery, the effect is of the richest, especially as the building next to it, as viewed from the Market Square, has an open traceried cloister round it, two stories in height, another unusually beautiful feature.

The tracery of the gables is, in some few instances, replaced in the Andreas Kirche by rudely sculptured representations of scenes in our Saviour's childhood, such as the "Adoration of the Magi," the "Flight into Egypt," and the "Murder of the Innocent;" but such tracery as occurs is of the usual type, and the great height both of the narrow buttresses and of slender mullions in the aisle window is extremely noticeable to one who is accustomed to the English proportions, though similar things are frequently seen in France and the buttresses, at least, need not be so substantial where the roofs are of timber as well tied.

The Cloth Hall at Brunswick, well known through being very generally illustrated in our text books, is a distinct disappointment

Cloister
Monastery of Poblet

DRAWN BY F. HAMILTON JACKSON, R.B.A.

It may be characteristically German, but it does not represent the best even of its class, being an overdone edition of the Lerbuitz Haus at Hanover, itself, as already noted, lacking in delicacy both in proportion and detail. When considered beside the beautiful Gothic and Romanesque of the churches, it is unworthy of notice; yet even these would lose much of their attractiveness but for their setting amidst a profusion of narrow streets of timbered houses, story overhanging story, set at all sorts of angles one with another, with tile-hung gabled roof and multitudinous dormers. Every street forms a picture; it is hardly possible to obtain any other than a good piece of grouping in the older parts of the town. Most of the timber used is oak, but elm is now and then to be seen; and that the construction is round, and the material lasting is evidenced by the age of the buildings, almost all dating back to the seventeenth and even the sixteenth century. As a rule the framing is rectangular, diagonals being most rarely used, and then generally merely crossing a plaster or bucknagged bay, and not cutting the main timbers. All the weight is thus brought as dead weight, without thrusts requiring inclined supports, and overhanging is thereby facilitated, being obtained by merely projecting forward the floor binders, supporting the short projecting portions by brackets (more for appearance than for weight-carrying), resting horizontal beam to carry the upper work upon the ends of these cantilevers, and filling the interspaces with either short filling pieces or with inclined boarding, painted or enriched. Generally the timbers are tenoned and pinned, but the pins are not always to be seen.

At present street after street, and courtyard after courtyard, is to be found of this picturesque work, to which we are reverting in English country practice, but which has almost disappeared from our towns; but this state of affairs cannot be expected to last much longer. Already the old Brunswick of the half-timber houses is surrounded by a fine new town; soon, it is evident, the old, with its narrow tortuous streets and extreme beauty, must utterly disappear.

It was when just on the point of leaving Brunswick, that a noticeable piece of modern construction came into notice in the railway station roof—a combination of wood and iron with a framed ridge, somewhat suggestive of those to the Boucherie at Ghent and the Hotel de Ville at Audenarde, only of low pitch and with the king post stopped short of the tie beam. The tie, though apparently timber, is, on consideration, seen to be a casing, probably hiding rod or bar iron; for in several cases it winds considerably, and the span is no less than 60ft., while no scoves are to be observed.

IV.—IN THE HARTZ-GEBIRGE.

Through trains are rare and travelling is slow in the hill country, though the hills are scarcely more formidable than those in Surrey; and consequently there were opportunities of examining some of the smaller villages. Save for their general picturesqueness, however, caused by their hill setting, and the universality of half-timber still hanging, they are scarcely worth attention, and the only thing seen to which notice need here be called was a soundly constructed and heavily timbered wooden bridge over the stream at Börssum, made of elm, set skewwise across the bend of the river, whose rapid current was prevented from washing away the bank by triangular groins, consisting of three piles driven in at the angles, having stout planking nailed to them.

Naturally, only light traffic could be allowed to pass over such a bridge—an English traction-engine would probably break it down; and the neighbouring railway bridge was of iron, with cross girders, strangely enough, built on the cantilever principle, at quite unnecessary expense.

Another halt took place at Vienenburg, pretty enough but architecturally uninteresting, and at length Halberstadt was reached late in the evening. This is an old town, at present but little visited, worthy of much more

attention than it receives. It not only contains much work of a similar class to that of Brunswick, but possesses its own characteristics, and is, in some respects, better and more varied in detail. The churches, of which there are several, all seem to have been commenced at the west end with two Romanesque Western towers. St. Paul's, one of the smaller, shows the process of building which all appear to have undergone in later centuries—the small Romanesque church still standing, but partly enclosed by a high and wide chancel at the east end—the commencement, evidently, of a great Gothic church, which was to have replaced the older work, as it has done in the other churches, certainly to the improvement of their proportion and dignity. In one of these there is a good deal of eccentric tracery, in which the straight line has been much used diagonally. The effect is far from beautiful, except in some cases where the line is vertical.

The Rath-haus is, however, the most notable building in Halberstadt, though it is small. Originally it seems to have been little more than a rectangular block, having small Gothic windows, and with a huge carved stone figure of uncouth form at one corner; but additions of the seventeenth century, in the form of an external staircase, and an oriel window to one side, and a Gothic bay at one end, of but little earlier date, have broken the outline, and render it most captivating. Possibly I may be wrong in ascribing different dates to these additions, for the Gothic and the Renaissance run very much into one another in these districts, and the Renaissance made its appearance late. In the oriel window, already mentioned, for instance, the corbel is groined with interpenetrating ribs, while four out of the five string mouldings round it—all except the larger top cornice—are precisely alike in contour, consisting of a fillet cyma-resta and quadrant, in downward succession.

Among the domestic work, the large proportion of overhanging timber buildings is quite as noticeable as at Brunswick, while the detail is more varied, and in some instances even more rich, though the construction is practically the same in all. One house exhibited, in the filling piece of the overhang, the largest egg enrichment I have ever seen, there being only one egg to each separate space, and really well it looked out in the timber; while others were simply moulded, and others, again, carved with cable, balls, or billet enrichments. The fillings of the panels in the timber work is usually plain, but in the richer houses the opportunity for display which they give has not been lost; and some are filled with stamped plaster, several with gaudy colouring, and some few with carved woodwork.

Mouldings, even on the main horizontal members, are rare, but their places are taken by bands of lettering such as quotations from the Scriptures and expressions of devotion, sometimes in Roman, but more often in the picturesque German character, and perfectly decipherable, though executed two and even three hundred years ago.

As might naturally be expected, a good deal has been made of the corbels in the better houses, particularly of those at the angles—as a richly traceried specimen in South Kensington Museum shows was at one time the case in England also—and though both well carved figures, grotesques are much in evidence. Canopy work is also to be seen, and mostly in excellent preservation, considering the length of time during which it has been exposed in all weathers.

The day devoted to Goslar, the next place visited, unfortunately proved cold and wet, so as to preclude thorough exploration. While the town seemed to be picturesque enough, its architectural characteristics were so similar to those of Halberstadt, so far as the general features of the churches and the houses were concerned as to call for no exceptional mention. Restoration had been freely indulged in, ruining the Kaiservath, and greatly spoiling the Rath-haus; but the latter still retained its traceried eaves, a picturesque if useless feature, and probably a survivor of crewellation, in an almost unrecognisable form.

(To be continued.)

A NEW GLIMPSE OF AN OLD HOUSE.

"When you have done, repair to Crosby Place."
—Richard III.

ANYONE who passes along Bishopsgate Street just now, and is not too busy to stop for a moment, can see what has not been seen to so great an advantage for many years—the whole side of the Great Hall of Crosby Place, a part of the veritable Palace of Richard III. It must be some two hundred years since the houses were built which closed in the view of the Hall from the street, and now that they are being demolished this interesting piece of fifteenth century London, famous in history and in literature, is revealed and can be seen in its true proportions. Before long, says the Daily Graphic, a hoarding and then the new buildings which will rise on the site of the demolished house will once more shut in the ancient hall and tower high above the roof of what Stow tells us was in its time the highest house in London. In his account of the parish of St. Helen's, Bishopsgate, Stow says:—

Then have you one great house called Crosby Place, because the same was built by Sir John Crosby, grocer and woolman. This house he built of stone and timber, very large and beautiful, and the highest at that time in London. He was one of the Sheriffs and an Alderman in the year 1470, knighted by Edward IV. in the year 1471, and deceased in the year 1475. Richard Duke of Gloucester and Lord Protector, afterwards King by the name of Richard III., was lodged in this house.

Sir John Crosby built the house and its hall in 1466. After Sir John's death his widow sold the mansion to Richard of Gloucester, and there, says Sir Thomas Moore, "he lodged himself, and little by little all folks drew unto him, so that the Protector's Court was crowded and King Henry's left desolate." There, then, in the very hall now so well seen in Bishopsgate Street, the "troubler of the poor world's peace," as Queen Margaret called him—and it was about the mildest of the epithets she used in her curse—plotted and intrigued. It was in the council chamber of the house that the Lord Mayor and a deputation of citizens offered him the Crown.

SHAKESPEARE'S REFERENCE.

Shakespeare was a resident in the parish of St. Helen, and, of course, knew Crosby Hall well. Three times had he referred to it in "King Richard III." In the second scene of the first act, that marvellous scene of the wooing of Anne at her husband's bier, after she had yielded to his suit, Gloucester begs "one favour at her gracious hand," and, on her inquiring what it is, says:—

That it may please you leave these said designs
To him that have more cause to be a mourner,
And presently repair to Crosby Place,
Where—after I have solemnly inter'd
At Chertsey monastery this noble King,
And wet his grave with my repentant tears—
I will with all expedient duty see you.

And in the next scene Gloucester bids the two murderers, "When you have done repair to Crosby Place." In 1483 Richard left Crosby Place for the Palace at Westminster. After being used as a residence by nobility of their day and as a prison in the days of the Civil Wars, in 1813 the upper part of the Great Hall became "the warehouse of an eminent packer." The "eminent packer" mutilated the place, and in 1831 the whole building was advertised to be let upon a building lease. That was the critical period in the history of the ancient mansion. A lady, who lived near, stepped forward to save it; others helped her, and thus this unique and splendid specimen of Gothic domestic Architecture was saved from destruction. What is left is but a part of the original mansion, which in the days of its glory consisted of two quadrangles separated by the great hall. Crosby Square, built in 1677, represents one of the quadrangles, and until lately the street front of the square hid the hall from sight. Now, as already said, these houses are down, and the exterior of the grand old historic hall of Crosby Place can be seen for a short time by all that pass. Its interior, as everyone knows, can be seen by simply going and lunching there.

Bases of Shafts

Windows Chapter Ho.

MELLIFONT ABBEY.

MELLIFONT ABBEY:

ITS HISTORY AND ARCHITECTURAL REMAINS.*

By ANTHONY SCOTT, M.S.A.

(Cor. Mem. Central Society of Architects, Belgium).

(Continued from page 430.)

EXTERNALLY the Chapter House presents no unusual finish, except that the buttresses are very neatly executed. The quoins and dressings are of the sandstone used throughout the Abbey buildings with general walling of local stone. The plinth or base mouldings are rather peculiar, and differ in character from other similar features of the Abbey. It consists of a filleted round or bowtell with a good projection, having underneath worked out of a separate stone a large scotia moulding. This plinth exhibits great marks of violent usage; it is very evident that decay has played but small part of its ruination.

Turning to the eastern gable of the Chapter House, only the discharging arch of the window, built with the thin slaty stone of the locality, is left. None of the wrought-stone work, except the sills, is left. A strangely-shaped sandstone key will, however, be noted as contrasting somewhat with the rubble arch, of which it forms the centre. A much obscured figure is carved on the keystone, what it represents would be rather hard to surmise. No remains of the stone dressings to this window, except those we have already mentioned, are *in situ*. Indeed, a closer examination will show that the window opening as we see it now was probably an enlargement of an earlier and smaller one, and that some other material than the earlier was used to form the later dressings and mullions. This material was brick of a deep red colour, and slightly glazed.

We know that the Cistercians were the first brickmakers in Ireland, and here is evidence of their use of home manufactures. The hood which surrounded this window was of moulded brick, as some very scanty remains will show. Again, the sill of this window is in three pieces, without the usual stools for mullions. In fact, the stone sill does not run through the whole width of opening, and the mullions have for their bases or lower portions moulded red brick of section. We cannot, of course, know of what description the tracery of this window was, or what may account for the use of brick in its mullions. A reasonable inference might be made that the tracery was also

Leaving the Chapter House, and again entering what was the eastern walk of the cloister, and turning into the southern or return walk, one or two steps bring us to the Lavabo. Here the monks performed their ablutions before entering the refectory, the entrance to which is immediately opposite the Lavabo. This building, long known as the Baptistry, may justly be described as one of the most remarkable of the many interesting architectural relics at Mellifont. It possesses somewhat of a foreign appearance, and closer inspection strengthens this impression, particularly as to the strangely foreign character of its mouldings and carvings.

On plan the Lavabo originally consisted of a regular octagon, with sides measuring 12ft. each externally, and having a clear span internally of 25ft. 9in. It was originally groined, the springing of three or four of the ribs still remaining. It is largely a matter of conjecture whether the building was groined with or without a central pillar. If arched from wall to wall, or rather from angle to angle, a considerable amount of thrust would have been exerted on the walls, which are of no great thickness, and incapable of resisting the thrust of groining. Had the section of the grain ribs been semi-circular, or of the same curve as the arched openings in the side of the octagon, the tops of the ribs would rise considerably higher than the indicated level of the upper floor, or possibly even above the window sills. If, as we may reasonably suppose, there was a central shaft from which

of brick. There, however, are the unmistakable remains of such material, and it is a pity that so little remains of this interesting use of the humble brick in our ancient Abbey.

Dumders

Tomb

MELLIFONT ABBEY.

* A paper read before the Architectural Association of Ireland.

the groin ribs sprang each to its internal angle of the buildings, this difficulty would not exist. Such a central shaft would follow other examples of Cistercian abbeys, where we find such shafts dignified by the name of marble tree.

No trace of such a feature was found at Mellifont. It might also too easily have fallen or been broken away at some time in the story of the Abbey's destruction. And, again, the foundations of footing courses of all the masonry at Mellifont are but shallow, and could easily have been passed by unnoticed, and removed with excavated material, or so scattered by various other causes as to be incapable of restoration.

Sir Thomas Deane is of opinion that a roofed verandah surrounded the Lavabo, such an erection would have protected the moulded stonework from the weather. It seems rather improbable that the builders of the Lavabo would have left such hollows to contain water to assist in the decay of the stonework, without providing outlets for the water, if there were no external verandah.

In the internal angles of the Lavabo, the groin ribs continue to the floor line, the horizontal moulded courses returning around them. Below the label course of the arched openings, the section of the ribs is slightly modified. The internal base or plinth course is also returned round these angle shafts, and presents a most delicate treatment. The small fillets between the mouldings are very fine and exhibit most subtle knowledge of this art by their design. The carving of the shaft, caps, and those of the groining ribs deserve close attention the delicacy of the carving and the beautiful design of each of them are some of the most interesting pieces of work among all the various subjects at Mellifont.

Some of them were executed in Caen stone which has slightly decayed, but the real and most apparent cause of their fragmentary condition was the hand of the deliberate destroyer, whose instrument of destruction has left its mark on nearly all of these examples of beautiful mediæval carving. Externally the wrought and moulded stonework of the lower story finishes at the string course above the arches, and gives way in the upper part to the ordinary rubble masonry, with dressed sandstone quoins. The upper part of the Lavabo presents no extraordinary features. The remains of the windows of the first floor are perfectly plain, and without dressings.

A curious and rather interesting fact about the Lavabo is the use of timber chain bars at the angles of the walls. These ties or bars, of which one is yet to be seen, are of oak. They are halved and crossed and bedded in the thickness of the walls on ordinary mortar. Each measures 5in. by 3in. in section. The remains of one of them are still so hard and undecayed that no impression can be made upon it with an ordinary knife.

The entrance to the Lavabo, which we have noticed was opposite the door leading into the refectory, was evidently a specially elaborate feature in this remarkable building. On each side or jamb of the door were clusters of five detached shafts, of which the base mouldings of some and the faint outline of others are all that at present remain. The bases to these shafts are all worked out of the solid stone of the base block, and are not worked separately and doweled to it, as found in other cases. Although no trace of it remains, we may well suppose this entrance to have had a central shaft or cluster of shafts, from which sprang the arches on to either side. That this is very probable, the width of this entrance compared to those of the arches opening in the sides of the Lavabo would seem to show.

The ruins of this part of the Lavabo and the sides of the octagon adjoining are fragmentary, and the work much different to other used at the Abbey. Any restoration of this doorway, or, indeed, the whole Lavabo, must be then only conjectural.

Immediately opposite the entrance to the Lavabo we find indications of the door leading into the refectory; of this room and the other monastic apartments but few remains are now to be seen. The vaulted apartment known as

the Califactory, and the narrow passage beside it, contain no architectural treatment worthy of a long notice in this paper. No traces of the western block of buildings containing the lay brothers' apartments are to be found in sufficient degree to enable us to conjecture their extent and appearance.

Here, then, we must leave the venerable ruins. Of their history pages on pages might have been written but for the oblivion which has swallowed up all the ancient records of its monks and brethren.

In conclusion, let me express my deep indebtedness to Father Joachim Hennessy, a Cistercian of St. Joseph's Abbey at Roscrea, from whose valuable "Guide to Mellifont" most of the history of that Abbey has been gleaned; to whom is due a tribute of praise for his admirable guide, and the patient and laborious care with which he compiled its various facts.

BRITISH ART OF TO-DAY.

By SIR EDWARD POYNTER, P.R.A.

THE Lord Mayor gave a dinner on Saturday night week at the Mansion House "in honour of Art." Mr. Geo. Fray (French Minister Plenipotentiary) and Sir Edward Poynter (President of the Royal Academy) occupied the seats on his Lordship's immediate right and left, and among the list of guests was fully representative of British Art. Architecture on this side of the channel was represented by Professor Aitchison, Mr. F. C. Penrose, Mr. Norman Shaw, Sir Arthur Blomfield, and Mr. T. G. Jackson. The Lord Mayor proposed "French and British Art." M. Armand Dayot replied for French, and Sir Edward Poynter for British Art. In the course of his speech Sir Edward said: "There are two elements which have gone to form the British Art of to-day. It has, to begin with, an originality and a sturdy independence of its own, but it also has another very marked characteristic in its readiness to adopt, to assimilate, and make its own what is good—perhaps even sometimes what is not so good—in the Art of foreign countries. Thus, while we have seen in the last half century artists of purely English habit form a school and rise to the highest eminence, on the one hand, through an ardent study of Nature, as seen with English eyes, amidst English surroundings, as in Millais, and, on the other hand, as in Rossetti and Burne-Jones, through a sympathy, also peculiarly English, with the

EXQUISITE TRADITIONS OF THE PAST

in poetry and painting, we have also seen numerous earnest students who, less self-reliant, and feeling that the English Art of Hogarth, of Reynolds, of Gainsborough, and of Turner, had so worked itself out in the course of years as to have degenerated by the middle of this century to a somewhat trivial mannerism, went abroad to Germany, to Belgium, and to France—principally to France—to acquire the instruction which they perceived was not to be had at home. As, my Lord Mayor, you have said, our artists have taken many a lesson from our French friends. Among these I may cite, first, Dyce—an artist of the highest gifts, now almost unrecognised, whose style was inspired by the rather pedantic resuscitations of Overbeck and Cornelius—and more conspicuously Leighton, our great president, a distinguished example of an Englishman, whose studies were almost cosmopolitan, bringing to his own country and applying in his own way the brilliant and accomplished style which he had acquired abroad. Both these distinguished men took the best that was to be had from foreign sources in their time, but neither of them was

A SERVILE IMITATOR

of any school, and they always remained individual and English. But the greatest impetus to this desire for learning more than could be obtained at home was given unquestionably by the Exhibition at Paris in 1855, the first International Exhibition of Art.

That Exhibition opened the eyes of our countrymen to that brilliant school of painting then at its zenith in Paris, while it showed us, no doubt, some of our own shortcomings by the close comparison which could there be made with the splendid accomplishments of French Art. It is hardly too much to say that to English artists of that time the names of Ingres, Flandrin, Gleyre, and other distinguished representatives of the classic school in Paris were virtually unknown; and still less known, if possible, were Delacroix, Decamps, Hébert, Marilhat, Robert-Fleury, and a host of others who formed the romantic school. I well remember the effect of that exhibition upon myself, and the enchantment of seeing for the first time the collected works of Decamps, a conspicuous feature of that exhibition; of Hébert, of Delacroix, and of Hamor, that most delicately fantastic of the Neo-classics.

A NEW HORIZON

was opened out before my eyes, their works were a revelation, and I was, I believe, the first of our artists who went to Paris to study. Soon others followed, more numerous as years went on, and drawing from that great school some of the qualities, both solid and brilliant, which characterised it and infused fresh vitality into English Art. The Art of landscape painting also, in common with the rest of our school, had at that time lapsed into a conventionalism which smacked of the landscape of the stage, and had lost touch with Nature; and it was contact with the powerful French school of that time, led by Rousseau, Daubigny, Corst, Dupré, and others, quite as much as the more elaborate fidelity and earnest study of nature of the Pre-Raphaelites at home, that so invigorated our landscape artists that they are now, I think I may say, second to none. Thus the Art of Constable, to which you, my Lord Mayor, have already alluded, and to whose influence the French painters readily admit their own great school of landscape was due, has returned to us after long years from across the Channel in a new and invigorated form. M. Armand Dayot has been good enough to express a hope that we shall put forth our best efforts for the forthcoming Exhibition of 1900 at Paris. If we do so I am certain that we need fear no competition, for I take it that British Art can now make a display very different from that which we were able to put forth in 1855. If so, it will be due not only to the force of native genius as displayed in our greatest men, but to the English desire to learn wherever there is something to be learnt, and to the English capacity for adapting and appropriating what is best in the Art of other lands, as we have adapted and appropriated to the best of our ability what we have learnt from our brilliant neighbours across the Channel.

The Cook Street Arcade, Liverpool, is so far advanced at the Castle Street end that it is almost ready for use. The hoardings have been taken down, revealing some half-dozen archways, the divisions between which are faced with choice polished marble, whilst over the arches is some beautiful carving in stone. When completed, the arcade will undoubtedly considerably enhance the appearance of the thoroughfare.

SINCE the Workmen's Compensation Act of 1897 was passed some insurance offices have made a very good profit by taking upon themselves the liability of employers in the matter of injuries received by their workmen. Acting on the co-operative principle, a number of employers connected with the clay-working industry have decided to form what is styled the British Clay-workers' Mutual Insurance Corporation Limited, which shall be for the mutual benefit of its members. The nominal capital of the company is £100,000, of which £20,000 is being issued in shares of £10 each with £1 called up. Further details may be obtained from Mr. H. Greville Montgomery, 43, Essex Street, Strand, W.C., and the information will, we think, show the substantial advantages offered to brickmakers, &c., by this new Company.

ELECTRIC BRACKETS.

SOME RECENT AND NOTEABLE EXAMPLES.

THE present day demand for sumptuousness is perhaps evidenced in the minor matters of taste and of art, more than in things of greater supremacy. Wealth alone

6364.

can pack a house full of famous paintings, but it is something more which adorns the rooms with really artistically designed chandeliers, electric brackets and the like. Of this latter, we illustrate three or four beautiful examples, which are manufactured by Messrs. Perry & Co., of

6418.

17, Grafton Street, Bond Street, W. We give a brief description of each design, which reveals its own merits sufficiently without the help of any wordy laudation.

No. 6363.—This is a two-light electric bracket in the Louis XV. style, made right and left hands, with scroll backs richly

moulded with palm branches and delicate "contournés," and carrying iris glasses to cover the electric lamps. Height 18½in., width 12in.

No. 6364.—Here is a somewhat similar bracket to 6363, but in the Régence style, rather heavier, with iris branches in ormolu to correspond with the iris glasses. Height 20in., width 14in.

No. 6357.—This torch bracket, in the Régence style, has the open back in well moulded ormolu, with delicate curves and scrolls enriched with leafage bound on with ribbons; the torch in bronze is encircled by a myrtle wreath in chased ormolu, and the electric light is covered by a globe to represent a flame. This flame shape globe, with internal orifice to admit of an electric lamp, was registered by Perry and Co. under No. 251,604. Height 26½in.

No. 6418 is a two-light electric bracket in the Louis XVI. style, with scarf back in ormolu, to which the branches are tied by a knot in the scarf, and having iris glasses to cover the electric lamps. Height 28in., width 14in.

No. 6449.—This illustration shows massive electric brackets in the Louis XVI. style from

6357.

an old model of the period, in ormolu with therm shape backs terminating with seed pod at the bottom, having acanthus foliage in the front and vase with festoons at the top; the branches are fluted and heavily clothed with acanthus leafage and seed pods, laurel festoon and drops suspended between them; the crystal glass ray shape globes are supported in flame pattern ormolu holders and enclose the incandescent electric lamps. The effect of these is extremely good. Height 23in., width 16in.

THE Westminster Vestry has adopted a scheme for the formation of a subway to facilitate vehicular traffic and to provide a safe crossing for foot passengers under Parliament Street and Bridge Street.

The parquet flooring in the upper hall of the Walker Art Gallery, Liverpool, having lost its original polish and beauty, in consequence of the constant wear and tear occasioned by the thousands of visitors who have passed over it, is now being renovated. The effect when the various woods—oak, sycamore, walnut, and ebony—are polished will be admirably in harmony with the general rich decorations of the building.

THE NEW GOVERNMENT OFFICES' ARCHITECTS.

A CORRESPONDENT signing himself "F.R.I.B.A.," writes to the Times as follows, *re* the selection of architects for the new Government offices: "It is to be hoped that the Government have made no mistake in the selection of the two architects to whom will be entrusted the design of the new buildings. One of the appointments is at any rate quite unexpected on the part of the profession. I

6363.

allude to that of Mr. William Young. You refer in your article to the fact that the Government availed themselves of the advice given by the council of the Royal Institute of British Architects as to the names of gentlemen who, in their judgment, were the best suited to have these commissions conferred upon them. In the list sent in by the Insti-

6449.

tute the name of Mr. Brydon appears, but that of Mr. Young is conspicuous by its absence. The profession to which I belong are naturally anxious to know how this has come about. To say the least, it is so much of a surprise that the First Commissioner of Works and Buildings might reasonably be asked to give an explanation of the circumstances from his place in the House of Commons."

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

August 3rd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense, which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

M. ALPHONSE LEGROS is designing fountains for the gardens at Welbeck. All those who admire the severe grace and classic dignity of M. Legros's art will be delighted to think that he has such a fine opportunity for the exercise of his special gift for this noble form of decoration. We hope that the example thus set by the Duke of Portland may lead to the cultivation of a branch of Art which, compared with what has been done in France and Italy, has been so greatly neglected in this country.

SIR HENRY IRVING managed to impart an amusing piece of by-play into the actual laying of the commemoration stone of the new theatre at Kennington. He used very skillfully—for his is a practised hand—the handsome silver trowel with which the architect supplied him. He carefully levelled the mortar, and then struck the stone with the mallet. So far this was quite in accordance with custom. But after the usual formula: "I declare this stone to be well and truly laid," he paused, with mallet again raised, and to the architect said quaintly: "But is that so?" Apparently the workmanship was not all that it should have been, for the stone was retouched, the mallet used again and again. "Is that well done now?" asked Sir Henry, and he and those near him laughed heartily when the architect and the contractor signified their approval.

THE advisability of the Council taking advantage of the Holborn to Strand improvement to erect an Hotel de Ville worthy of the metropolis is urged by Mr. Frederic Harrison. "It is a scandal," he declares, "that the largest city in the world condemns its municipal authority to shift with huggermugger lodgings—mean, unhealthy, and inconvenient. The Council ought to have a seat at once spacious, central, and imposing. When the new avenue is completed, no building in London will in these qualities surpass Somerset House. It should have water communication with Parliament in a few minutes, and up and down Thames in special electric launches. The new Broadway will connect it with the north, with the Courts of Law and public offices. There is no reason why wills, stamps, audit, and the like should continue to monopolise the finest place of Old London. It should belong to London, and be devoted to London. The vast area to be cleared by the new scheme will offer ample sites whereon modern and commodious rooms might be erected for the miscellaneous departments which are scattered about Sir William Chamber's grand palace."

WITHIN the ruins of the ancient "Pilgrims' Church," which are charmingly situated at the

confluence of the Taff and Cowin, in the parish of Llanfihangel Aber Cowin, near St. Clears, in Carmarthenshire, a religious service has recently been held. This ancient structure has become unroofed, and nothing is left to remind the visitor of its former grandeur but bare walls wrapped with ivy and other encircling plants. The building has been gradually crumbling into decay, and little is left but the walls and tower, whilst the floor, watered as it is with every shower of rain, bears a luxuriant growth of various grasses.

It is associated with many a legend, and here the archaeologist and the tourist may find inscribed in stone the records of the distant past. The old church had been left to decay until the institution of the present vicar, who directed his labours to the enclosing of the churchyard and the preservation of what remained of the ancient church. It is called the "Pilgrims' Church" on account of the pilgrims who lie buried there. The building is of Norman style, having a massive square tower at the west end, now clothed with ivy. On the right hand as one enters the tower from the churchyard there is to be seen a holy water stoup, and at the south entrance into the nave there is another. On each side of the door which opens from the tower into the nave are to be seen small square nooks, much broken. In the north wall, near the chancel arch, is a small opening containing seven steps in a dilapidated condition. In the churchyard are to be found the graves of five holy palmeres, with carved symbolical effigies on their tombstones in a good state of preservation.

A CORRESPONDENT sends us a cutting of an advertisement recently appearing in a Natal newspaper. The announcement is as follows:

F. UPTON,
Government Surveyor and Architect,
228, CHURCH STREET,
Maritzburg.

The architect's life in South Africa, freed as it evidently is from the niceties of professional etiquette and other burdens of an older civilisation, should be sweet indeed! But one would have thought that Natal was a sufficiently wide field for the activities of the "Government Surveyor and Architect" without breaking new ground in his unofficial but professional rôle.

WHAT are termed "the arbitrary proposals of the London County Council on the subject of fire protection," has called forth a cry from the City Press. "It will be remembered," it says, "that, urged to action by the Cripple-gate fire, the Building Act Committee decided that every factory must be fitted with a stone staircase so as to facilitate the escape of the workers in the event of a fire occurring. For all new buildings this may be a very wise precaution, but to make the regulation retrospective would be a cruel injustice on property owners, as has been urged from the very first, as in many instances the construction of such a staircase would involve a terrible expense without any corresponding advantage being obtained.

"At the outset the committee appeared to be indisposed to listen to any argument, but now, happily, following on a deputation from the London Chamber of Commerce, they are showing themselves rather more amenable to common sense, and exhibiting a desire to grant what is asked for. As a result, alternative suggestions are to be considered, and the Chamber, in a circular that has been issued, expresses its willingness to assist traders in formulating them. What is more, the Chamber announces that it proposes to consider test cases, supporting them where necessary. In order that this action may meet with the favourable reception that is looked for, it is, of course, advisable for a united front to be shown. Traders, therefore, should make a point of communicating with the Chamber when any doubts and difficulties arise on the point at issue."

In the forty-fifth report of the Department of Science and Art, just issued as a Blue-book, it is stated that during the decennial period from 1888 to 1897 there was a considerable increase in the number of schools, of classes, and of pupils under instruction in science, but as compared with 1896 the number of schools decreased in 1897 by 159, while the number of pupils increased by 3442—from 194,354 to 197,796—and the number of classes in different branches of science decreased by 1398—from 10,500 to 9102. These last figures, the report states, are of no significance as a means of comparison, owing to the increase in the number of schools of science—formerly termed organised science schools—the separate classes in which are not counted as separate classes in the above figures. The decrease in the number of schools is, no doubt, largely due to the absorption of the smaller schools in the larger and better equipped schools maintained or established by local authorities under the Technical Instruction Acts.

BUT the increase in the number of students under instruction—the really important factor—is a satisfactory indication that the value of the instruction given in these schools continues to be appreciated, notwithstanding the great increase of classes in more specially technical instruction. The number of individual students examined was 101,526, against 99,818 in the previous year; the number of papers worked was 151,212, against 152,630; the number of papers passed was 62,261, against 62,886; and the number of first classes in the elementary and advanced stages was 43,073, against 41,419. The payments to science schools on results and attendances amounted in 1897 to £172,495, and in 1896 to £157,916. In the art division during 1897, in 20,493 elementary day schools, 2,286,431 scholars were taught drawing and examined—an increase of 332 schools and of 36,361 scholars. There were also 17,841 pupil-teachers and ex-standard scholars examined. The grants amounted in 1897 to £181,065, and in 1896 to £176,224. In 1083 evening continuation schools 51,633 scholars were taught drawing, the grants earned amounting to £2702. In the previous year the figures were 873 schools, 40,459 scholars, and grant £2105. Classes for manual instruction in connection with 1271 elementary day schools were examined and earned £25,781 on account of 106,423 scholars—a large increase. The number of art schools examined was 1849, against 1851 in 1896, and the number of students was 146,720, against 146,193. Of the 146,720 students, 142,293 were of the industrial class. The expenditure of the Science and Art Department during the year 1897-98 was £814,862.

THE tenth annual meeting of the Society of Art Masters was held in the Lecture Theatre of the South Kensington Museum last week, Mr. W. Scott, of Norwich, presiding. Mr. F. Ford, the secretary, read the report of the Council, which, after congratulating the members on the continued progress of the society, said the matters that had chiefly engaged attention during the past year had been the new scheme of attendance grants, the associateship of the Royal College of Art, and the contemplated Bill in relation to secondary education. With respect to the attendance grants, statistics had been obtained from the members showing that the new scheme would be disastrous to many schools, but assurances had been given that this was not intended, and that modifications of the scheme had been made to guard against the danger. As to the associateship of the Royal College, the Council regretted that their representations had been unavailing to prevent its limitation to South Kensington students, the desire of the society being that the distinction should be conferred on all masters who had for a certain period been in charge of schools as successful teachers. The Bill dealing with secondary education, it was understood, would only be introduced and debated in the House of Lords this session.

MR. SCOTT was re-elected president of the Society, and in the course of his address ex-

pressed the hope, in view of the national importance of the schools, that the modifications of the new attendance grants would prove satisfactory. He referred to the question of the registration of teachers, and, with regard to the proposed secondary Education Bill, said it was very important that the schools should not be handicapped by any new legislative action, but should rather be further encouraged and developed. In reference to the Associateship of the Royal College, he hoped that all successful and capable masters would yet be recognised by the Science and Art Department whether they were trained in a college or not. Mr. W. Wallis was re-elected vice-president, and the council having been elected, the meeting, after considerable discussion, passed the following resolution unanimously:—"That the Science and Art Department be requested to consider whether they cannot consent to confer an honorary associateship of the Royal College of Art on all art masters wherever they have been trained who possess the certificates required by the conditions attached to the associateship, or, having fewer certificates, have been successfully engaged in teaching in schools of art for a certain number of years." The meeting was adjourned.

THE colour print is the fad of the moment—the big game of the collector, who, however, cares for it only when it can boast a fairly respectable age and when it is more or less rare. The amusing experiments made in Paris and Munich to-day have not the charm for him of the most indifferent little Bartolozzi. But still, if the value he gives to this sort of work is largely fictitious, some of the old colour prints are really very beautiful, while almost all have a certain decorative quality that is not unpleasing. They have something of the quaintness, though with a difference, of the "cock-eyed primitive" and its golden background. If, with Mr. Ruskin, you can see in William Hunt the breakfast or morning-room artist, you might describe the colour print after Morland, or Stothard, or Hamilton, as the Art for the cottage.

At the Fine Art Society's many of the prints in their little oval frames suggest the very rooms upon whose walls they should find an appropriate place. The collection is decidedly interesting and representative. There are examples of the principal English engravers of the period; there are even two or three Debucourts. And it is curious to note that the most successful prints of the old days, as of our own, are those in which the colour scheme is the simplest. Where a purely conventional scheme of greens and reds is employed, or where, as in the reproductions of Downman, there is just a touch of colour, the effect is far more decorative and dainty, is far truer in fact than when there is an elaborate attempt to give the exact colour and tone of a picture, as in several of the engravings after Morland. But, when all is said, the truest, the most faithful, the most sympathetic copies are those that make no attempt whatever to reproduce colour: the admirable plates of Wilkin and Watson and Ward and Green and Smith. The Fine Art Society's collection includes a few delightful mezzotints by the masters of the Art, and it is in their rich blacks and silvery greys that you must look for good colour. The engraving after a picture can never be an exact facsimile, and the more the conventions and the reproductive medium are respected, the more satisfactory is the result. We think, therefore, that it is in original rather than reproductive engraving that the artist introduces colour to best advantage; the reason probably why the colour prints at the Champ-de-Mars Salon almost any spring are—though most people refuse to admit it—of greater artistic merit than the earlier prints as you see them in such a collection as the one now on view at the Fine Art Society's.

It has been current of late that the Old Bailey was at last to come down, and that the plans had been passed for the New Bailey that was to take its place. A representative of the Daily Graphic, making inquiries at the Guild-

hall, discovered that this did not exactly represent the state of the New Bailey's development. The plans, a clerk in the City Surveyor's office informed him, had been drawn up years ago, but they were not quite ripe for publication yet. In fact, the clerk believed that they were at that moment under discussion at a meeting of the City Lands Committee, at which the City Surveyor himself was present. The Press representative thereupon sent in a message to the City Surveyor to ask if he might see the plans, or—in the event that they were not quite complete—if a day could be named when they would be so, and when he might profitably inquire again. The messenger returned after a few moments with the City Surveyor's compliments and the message that the enquirer might "inquire again in twelve months." The plans are, in fact, in an embryo stage. Her Majesty's judges have given their approval to the reconstruction of the courts, but that is nearly as far as the scheme has arrived. Neither the cost nor the incidence of the county rate to pay for them have yet been decided upon, and prosecutors and counsel, witnesses and prisoners, may confidently reckon on breathing the Underground Railway air of the Old Bailey for some years to come.

THERE are now to be seen, at the South Kensington Museum, in one of the galleries of the South Court, three designs of great interest by the late Sir Edward Burne-Jones, Bart. The most important work is the design for the mosaic of the Tree of Life in the American Episcopal Church of St. Paul, Rome. This was painted in 1892, and the glass mosaic was produced by Salviati, of Venice, in the following year. The second is a water-colour drawing of the symbols of the Evangelists, a design for portion of a stained glass window at Castle Howard. The third design is due to the liberality of Mr. C. Fairfax Murray, who presented to the Museum a model, showing the scheme of the mosaic decoration in the apse of the same church in Rome. The subject represents the Heavenly Jerusalem. To the right are the three Archangels, Michael, Raphael, and Zophiel, and to the left the Archangels Chemuel and Gabriel, the place for Azazel (or Azrael) being vacant. Above is a company of angels, and beneath are the four rivers of Paradise. The model has unfortunately been somewhat damaged in transit from Rome, so that the two figures, probably Zadkiel and Uriel, in the outside arches, are wanting.

SHOREDITCH is one of those quarters of London which might be made distinctly more endurable and less depressing if they were less smoky and grimy. The Great Eastern Railway Company has just been convicted at Worship Street for permitting black smoke to escape from their electric lighting works in Shoreditch High Street. The company produced evidence to show that the furnaces and boilers were of the best construction, and properly worked, and that the stokers were competent. Nevertheless, it was proved that for eighteen minutes out of twenty-eight black smoke was pouring out of the chimney-stack. The magistrate made an order for the nuisance to be abated forthwith, but, of course, the inevitable appeal will come in to interpose some considerable delay. Nevertheless, it is gratifying to see that the authorities are sticking to their guns, and continuing to prosecute offenders who do so much to make London hideous.

MR. ALGERNON ASHTON writes as follows:—Please permit me to draw your attention to the present state of the fountain next to Drury Lane Theatre, lately erected by public subscription to the memory of Sir Augustus Harris. Passing there the other day, I was surprised and grieved to see that this handsome fountain looked like going fast to decay, for not only was there no water at all (and apparently had not been for some time), but the basin itself appeared to be a receptacle for peashells and other rubbish. Is it really too much to expect some of the members of the committee who were the means of providing

this memorial to take the small trouble of keeping it in decent order?

THE Grand Trunk Railway, among other devices for reducing its working expenses, does its whitewashing by steam. It has a regular whitewash train—or rather two trains, one for each division. The apparatus consists essentially of an old engine in which the boiler does duty as a receiver. Into this the whitewash is sucked from barrels as required, and there it is kept in agitation by a Westinghouse pump. From this it is ejected by another brake pump as a fine spray, so that a man can lay the colour on as if he were watering a garden with a hose. In this way he can whitewash two or three stations a day. The most curious feature of the engine, for a Canadian one, is that it has a straight cylindrical funnel so that when it goes into the shops the nearest smoke-jack can be drawn over it like a sleeve, and it can smoke away merrily without distributing any smuts on the freshly-whitened walls.

WHATEVER the dinner, "In honour of Art," at the Mansion House, lacked in the way of attendance of French artists was made up for by the large number of members of the English Academy who were present. Probably there has seldom been a gathering, outside the Royal Academy banquet, when so many of these have been present. The Egyptian Hall has recently been thoroughly redecorated, but we are afraid that the statuary and the gaudy banners can hardly have impressed our friends from over the water with civic ideas of art in form or in colour. The reception rooms, after the dinner, were hung with pictures from the Lord Mayor's collection, showing that not only is he a patron of English Art in the matter of English painters such as Turner and Reynolds, but of French painters such as Troyon. It is not generally known that the Lord Mayor started life in a humble walk of art—namely, as an engraver of silversmith's work; a fact which in no wise abates one's admiration for him in his present position.

THERE is but little likelihood of the National Monuments in Churches Bill becoming law this session, although there would probably be but little opposition to it in the Commons after it had got through the Lords. The reason for the Bill is a sound one (says the St. James's Gazette), for at present the ordering of everything is at the disposal of the Dean and Chapter, and what one Dean approved his successor might disapprove. The Bill would provide that when a national monument had been erected nothing could be done to it save with the permission of the Crown and Parliament.

THE railway companies seem to be bestirring themselves to do away with the reproach, which has so long attached to them, that they are the most inartistic corporations of any in existence. The example which was set by the energetic Great Eastern Railway Company, in placing in their carriages photographs of the various points of interest on their system, has now been copied by almost every railway in England; although some of them still persist in adhering to the terrible coloured illustrations of their various hotels, which are generally positively infantine in their elevations and drawing. Fresh departures have been made this season in the attractive holiday leaflets issued by the Great Northern Railway Company.

THE proposal to establish some permanent memorial to the late John Millais, P.R.A., was carried a step further the other day, when an important meeting of R.A.'s and others was, by permission of the Prince of Wales, held at Marlborough House. The Prince, owing to his recent accident, was unfortunately unable to preside, as he wished to do, and in his absence the Duke of Westminster filled the presidential chair and submitted the proposal to the meeting. The scheme has assumed no definite shape so far, but a sub-committee of a highly representative character has been

appointed to report to the general committee the form the memorial shall take. Until this has been done no appeal will be made to the public for subscriptions. It only remains to be said that the general committee is as influential and representative as such a body could be.

SOME panels of old Brussels tapestry realised good prices at Christie's, a set of three panels, illustrating the Metamorphoses of Ovid, selling for £700; six panels with the history of Noah for £300; four panels with landscapes for £450; and an oblong panel with a boar hunt in a forest, 98 guineas. A panel of old Gobelin tapestry, representing the trial of Susanna, fetched £105. In the same sale a pair of Louis XVI. marqueterie encoigneurs, mounted with chased ormolu, the property of the Earl of Haddington, sold for £185.

THE variations tenders occasionally exhibit constitute a standing marvel. In three cases referred to in the current agenda of the London County Council this singular characteristic is strikingly exhibited. In one case the lowest tender was £2630, and the highest £6912; in a second the lowest was £16,900, and the highest £47,000; and in the third the two sets of figures were respectively £6134 and £13,750. What a fine profit would accrue in each case to the contractor at the top of the list, were he given the order!

THE long-talked-of recognition of the part played by Oliver Cromwell in our national history seems at last to have taken definite shape. By the generosity of Mr. Charles Wertheimer, Bernini's bust of the Protector, which was formerly in Lord Revelstoke's collection, has found a resting-place in the Houses of Parliament. It is placed at present in the Lower Waiting Hall of the House of Commons. Before many weeks are past a larger memorial, Mr. Hamo Thornycroft's colossal statue of Cromwell, will be ready for erection. It is at present being cast. The site for it has not yet been finally settled, but it will probably be in Parliament Square.

THE re-housing of the County Council is a standing grievance at Spring Gardens, and it was again brought to the fore by the Chairman's review of the work of the County Council during the past year. Mr. McKinnon Wood recommended members of the Council, instead of viewing overcrowded and insanitary areas, to view the Council offices now scattered about in Spring Gardens, Craven Street, Whitehall Place, Pall Mall East, St. Martin's Lane, and Charing Cross. In this way Mr. Wood thinks a long and profitable afternoon might be spent. It would be profitable, indeed, if very soon a new scheme could be brought forward to erect a City Hall worthy of London. Perhaps the solution will be found when the new Strand-Holborn street is commenced and the Council has to deal with the cleared areas; but meanwhile the Council were again called upon last week to incur fresh expenditure in not merely hiring but erecting additional offices for the staff.

MR. E. WHITE WALLIS, the secretary of the Sanitary Institute, has applied to several committees of the City Corporation for the loan of diagrams or models relating to public works in the city, as exhibits in connection with the autumn congress of that Institute, to be held in Birmingham next September. The Insanitary Property Committee is one of those communicated with, and they have given sanction for the loan of the plans of the labourers' dwellings in Gildart's Gardens and Ford Street. These will undoubtedly arouse considerable interest, as the general arrangement of the buildings has already been favourably commented upon by the representatives of municipal authorities who have visited Liverpool from far and near to inspect them. The Lighting Committee have referred Mr. Wallis's application to the city electrical engineer, and probably some acceptable loans will be offered from that department.

AN INTERESTING LANCASHIRE CHURCH.

ABOUT three miles north-west of Ormskirk lies the ancient Parish Church of Halsall. It has not the massive and imposing aspect of the ponderous, weather-worn, time-stained pile beneath which lies the dust of many generations of the House of Stanley; nor is it so rich in storied monuments, antiquarian associations, and legendary lore. Its history, however, even though the ecclesiastical archives yielded no information—which is far from being the case—could be constructed in a great measure from the architectural relics in which the church abounds. These belong to periods extending back to the Early English, which may be put at about the thirteenth century. The clustered shafts supporting the font are evidently of this period, and excavations in all probability would reveal

NORMAN AND SAXON REMAINS,

since the church is dedicated to that holy man, St. Cuthbert, whose name is associated with other foundations in the County Palatine. The church has an octagonal tower surmounted by a spire. Standing at a slight elevation, on the edge of a wooded demesne, it has a charming setting. At the first glance from the roadway it has a somewhat modern look, but a nearer inspection of its exterior reveals its ancient character. It is abundantly supplied with gargoyles—those ugly, grinning demoniacal masks which the mediæval craftsmen carved with so much skill, and in the designs of which they displayed such a fertile, not to say ghoulish imagination. They are all here, these impish figures, as if imported from the nether world, leering at the spectator—the foul fiend himself, with his cloven foot, and a whole host of eerie, nondescript creatures. But the carvings are not all of the grotesque and diabolical order. There are some heads and faces, both outside the church and in, that are even

BEAUTIFUL IN THEIR EXPRESSION.

The finger of time, and the more ruthless hand of the vandal, have failed to destroy the serenity of their aspect. The most interesting parts of the church are the chancel and the north chapel. In the east chancel wall to the north, and high up above the glowing triptych, representing the vision of St. John the Evangelist, there is a beautifully ornamented niche, which, perhaps at one time, contained the figure of a saint. The canopy is richly carved, and the corbel on which the figure rested contains a design of oak leaves and acorns in high relief. In the south wall are four arches, three of which form the sedilia. The fourth and the easternmost bay contains a piscina, the bowl being beautifully carved. In the centre of the exterior of the bowl there is a carved mitred head in high relief, which is believed to represent St. Cuthbert. At the terminations of the arches heads are carved, one of them being a bishop, wearing his mitre, and another, a close-cropped head, with a curious, conical, knob-crowned cap. There are no less than

FOUR PISCINAS IN THE CHURCH.

The one just named has no drain, and is accordingly believed to have been the holy water stoup of the porch. The recumbent figures of a knight and his lady, beautifully carved in alabaster, occupy an altar tomb on the south side of the chancel. The angry blood mounts to one's face as one reads the placard placed on this tomb, appealing to the looker-on to respect the monuments of the dead. But there are cogent reasons for the entreaty—some thousands of reasons, in fact. Every scratch and incision made by Tom, Dick, and Harry, with convenient jack-knife, on this hard, polished stone, constitutes a valid reason for the injunction. The knight is literally scored from head to foot with the initials of generations of vandals and desecrators. No erratic block of the ice age was ever grooved and striated by the action of grinding glaciers as these poor monuments have been by the implements of would-be purchasers of a cheap immortality. It is some consolation, however,

to know that this passion for cutting dates and initials on our monuments is not a product of modern times. It seems to be a failing of the race. On a buttress in the north chapel some visitor has carved his initials, with the date 1682, and, for some unexplained reason, close by the inscription has been faithfully reproduced. The armour-clad knight and the lady lying by his side—her face mutilated—are stated to be Sir Hy. Halsall, who died in 1523, and his wife Margaret, daughter of James Stanley, Bishop of Ely, and brother to the first Earl of Derby. Opposite, against the north wall of the chancel, there is the effigy of an ecclesiastic, with his hands clasped in prayer, also carved in alabaster. His tunsured head rests upon a cushion, and at his feet reclines a dog. Over the tomb there is a magnificently decorated arch. The effigy is considered to be that of the Rev. Richard Halsall, Rector of Halsall (third son of Sir Hy. Halsall), who directed by his will, proved in 1563, that his body should be buried "in the chancel of the p'iche church of Halsall afore sayd in the towmb made in the wall upon the north syde of the same church." Some of the choir stalls are of oak, finely carved and black with age. Those on the south side contain misereres

CARVED WITH QUAIN DESIGNS,

like the seats in the choir stalls at Whalley Parish Church that were removed from the Abbey. The subjects of these carvings on the south side are given as follow—from east to west—by Messrs. Hy. Taylor and R. D. Radcliffe in "The Transactions of the Historic Society of Lancashire and Cheshire":—(1) Two naked men wrestling, each apparently encouraged by a monk. The supporters are conventional flowers, delicately carved. (2) An angel, winged and feathered, holding a key in either hand, and wearing a cap, in front of which is a plain cross. The supporters are dragons. (3) Head of a venerable-bearded man. The supporters are conventional roses. (4) An eagle in the act of flight. The supporters are small eagles. (5) Fox and goose. Supporters: Conventional Tudor roses, boldly carved. (6) An angel, winged and robed, holding a book and wearing a cap, with a plain cross in front. Supporters: Tudor roses. The only remaining ancient miserere on the north side represents two dragons fighting. The divisions between the stalls are massive in character and well moulded. They are further

ORNAMENTED WITH CARVINGS OF ANGELS,

some of them bearing shields. The desks in front of the boys' seats contain some fine ancient carving; the ends, 4in. thick, are richly panelled and carved. The final of the western stall end, on the south side, is the eagle and child (the Derby crest); that on north is a lion. "These misereres," the authors of the article in question observe, "were carved before the publication of the 'Mortæ Encomium,' in which Erasmus so vigorously lashed the monks on their worldliness, sensuality, and folly. The English are proverbially a sport-loving nation, and no Englishman, however unsportsmanlike, could seriously object to the wrestling match represented in one of these carvings; but nowadays we should hardly expect our parish clergy to act as backers in such a contest." One of the chief glories of the church is the door and the doorway, by which the north chapel, now used as a clergy vestry, is entered from the chancel.

THE MOULDING OF THE ARCH

is remarkable for its beauty and its extent, and the upper portion of the door is richly carved. The massiveness of the lock and the key—nearly 1ft. long—are striking features. "A noticeable feature of the chancel," state the writers above referred to, "which has been the subject of much comment, is the hand held up in benediction, from the apex of the great east window hood mould. It is carved in somewhat flat relief on the face of a large block of stone, and towards one end of it. This stone has apparently been inserted, and it has been suggested that it encloses relics."

LONDON COUNTY COUNCIL.

REVIEW OF THE YEAR.

A YEAR'S work of the London County Council is a subject of no little magnitude when it becomes necessary to treat it within the compass of even a tolerably long address. Many phases of the work must necessarily be neglected or passed over with only a few general remarks; and such remarks in Mr. McKinnon Wood's speech, in reviewing the work of the past twelve months at last week's meeting of the Council, as contain a "building" interest we report:—"I shall, I am sure, be pardoned if I do not attempt even a reference to much of the work which is carried on so adequately by our committees as to pass almost without remark by the Council. For example, we all know how indispensable is the work of the Building Act Committee, and most of us are aware that its members devote themselves for several hours at each meeting to a mass of dry but important detail; yet it would be impossible to give any adequate idea of what they accomplish in such an address as this. The work of that committee, like that of the Asylums and several other committees, is an illustration of the purely administrative labour that is undertaken cheerfully and steadily week after week without hope or desire of public recognition.

PUBLIC HEALTH.—MAIN DRAINAGE.

A primary duty of the Council is the service of the public health. I have no intention of dwelling on the familiar facts connected with the past improvement of the main drainage system and the condition of the lower river. You have heard that there are enthusiasts who dream of restoring the "silver Thames" to its ancient pride as a salmon river. I do not know whether this hope is shared by the committee, but it is certain that they are not content to rest on their oars, or be satisfied with the great improvements they have effected if further improvements prove to be practicable. They have, therefore, been engaged for some time past in experiments in the filtration of sewage through a coke filter. At the southern outfall the raw sewage has been passed through a 4ft. coke filter for several weeks. A purification of 65 has been obtained, and better results are anticipated as the condition of the filters become more matured. The depth of the filter is now being increased to 8ft., and the experiment will be continued with a single filter, and also with two such filters in series. The sewage will, in the second case, therefore, be treated to double filtration. A small experiment conducted on this principle gave a purification of 95 per cent., producing an effluent incomparably purer than the river itself. At the northern outfall a large 6ft. filter is now being used for filtration of the sewage effluent, which has already been subjected to chemical treatment and sedimentation. An average purification of 80 per cent. has been effected, and goldfish have lived in this filtered affluent for over three weeks.

HOUSING AND TRAMWAYS.

The next department affecting the public health is that connected with the housing of the people. It is generally recognised that the conditions under which the committee is compelled to work are too rigid and stringent, and there is a general hope that such relief as is consistent with financial stability may be granted by the Treasury. The obligation, for example, to replace the cost of the land within sixty years is undoubtedly not in accordance with commercial practice, or necessary to meet the requirements of sound finance. One point appears clear. The population of London is, as regards the middle class and a considerable portion of the upper working class, a very mobile population, in this sense, that it makes no difficulty in finding house room at great distances from its work in any direction in which travelling facilities are provided. It is a lower class which is affected by the problem which we are considering—a class which tends to crowd neighbourhoods in which

work, often casual work, can be obtained. In such neighbourhoods, as a rule, the value of land is enormous, and the cost of housing prodigious. Obviously, to increase the mobility of this class is greatly to assist solution of our problem. We hope that efforts to enlarge the number and convenience of workmen's trains may be successful, but we have one great means of communication which will soon be largely in our hands, and for the development of which we shall be responsible. I cannot help thinking that much is to be hoped from the development of the tramway system and the employment of electric traction. It would be immensely to the advantage of London to complete, accelerate, and cheapen this great means of communication, which is for many reasons one of the most convenient for a working-class population. Our lease to the North Metropolitan Company gives us rights of developing the lines in co-operation with the Company, the exercise of which circumstances beyond the control of the committee have hitherto hampered. I hope that the difficulties which have arisen may be removed by the public spirit of the local authorities interested. The London Tramway Company's lines south of the Thames will be in the possession of the Council on January 1st. In this case it is important to note that the Council was able to take such action as ensured to the ratepayers the profits of the line from the date on which the Council was legally entitled to purchase. The Council has decided to retain the control of these lines, and we shall have in our hands not only a valuable municipal asset, but a potent instrument for combating the evils of overcrowding, and for adding to the comfort and convenience of the travelling public.

STREET IMPROVEMENTS.

Geographically connected with the clearance of the insanitary Clare Market area, which the Council is now carrying out at an estimated cost of £216,000, is the street improvement from Holborn to the Strand. There appears to be a general consensus of opinion that the proposal will result in a magnificent boulevard which will add to the dignity and beauty of the capital at a minimum of cost to the ratepayers. A road 100ft. in width will take the place of narrow and tortuous lanes, and it is intended to make provision that the buildings erected should be architecturally worthy of so fine a site. As has been shown by the chairman of the Improvements Committee, Mr. Shaw Lefevre, who brought to its service the experience of a First Commissioner of Works, it may be expected, even financially, to result in ultimate benefit to the ratepayers. In connection with this improvement housing accommodation will be found for the full number of persons displaced. Complementary to this scheme are two other schemes previously sanctioned by the Council, the removal of the block of buildings at Holywell Street and the widening of Southampton Row, which will be carried out by agreement with the chief landowner, the expiry of leases affording a favourable opportunity. The total estimated cost of the street improvements for which Parliamentary powers will be sought in the next session amounts to £1,100,000. The improvements which the Council is at present engaged in carrying out will cost nearly 1½ million sterling. From March, 1889, to this date, the Council has voted an expenditure of 3½ millions on street improvements apart from the clearance of insanitary areas, and the total length of streets affected amounts to 5½ miles.

PROTECTION FROM FIRE.

In another direction the Council has resolved unanimously to increase its expenditure, namely, in adding to the number of its fire stations and otherwise improving its appliances for the protection of the metropolis from fire. For this purpose it has sanctioned an additional expenditure of £197,000 on capital account; and the increase in annual maintenance is roughly estimated at about £30,000 a year. Other committees, the Building Act and the Theatres Committees, are charged with precautionary duties in regard to fire. Warned by the awful calamity in Paris, the

Theatres Committee has introduced a Bill requiring a licence to be obtained from the Council before buildings may be used for bazaars, such licence to be obtainable at any time. New rules have also been made for the prevention of accidents in the use of the lime-light and cinematographs in places of entertainment. The Public Control Committee report that they have investigated 301 cases of lamp accidents, in which 36 lives were lost.

WATER.

The Water Committee has been engaged during the past year chiefly in presenting evidence to the Royal Commission. In consequence, no steps have been taken by the Council for the acquisition of the water supply. Unfortunately, the truce does not extend to companies, and the Southwark and Vauxhall Company have strengthened its position by legalising its overdraft from the Thames, and by increasing its rights of drawing water from the river at a point nearer London than was recommended by the last Royal Commission. The Council succeeded in obtaining the insertion of a provision that no increased claim should be admitted on account of these new powers in the event of purchase within ten years; but I cannot help feeling that, notwithstanding this safeguard, there can hardly fail to be an increase in the cost of purchase as a consequence of the conferring of these new and valuable rights. Although the Council may not be unanimous on other points, I think there will be a general concurrence in the opinion that an early settlement of this question is in the interests of the ratepayers and water consumers of London.

HISTORIC BUILDINGS.

Few Londoners adequately appreciate the wealth of the capital in buildings of historic or architectural interest. The Council last year obtained power to expend money for the preservation of such monuments of the past. With the assistance of various archaeological societies, it is preparing a most interesting register. The first section is about to be printed, and deals with the East End parishes. A register of the whole of London will gradually be prepared.

THE WORKS DEPARTMENT.

The department has been carried on under the new management for a little more than a year. Of the work for which the new management is solely responsible, the amount which has been completed, passed by the committees, and reported to the Council is not yet large. In fact, some of the works commenced under the old management are not yet completed and reported. So far (according to the standards of comparison adopted by the Council) the cost of the estimated and jobbing works carried out entirely under the new management shows a balance below the estimates and the schedule values respectively, and the quality of the work has been satisfactory.

The Victoria Home at Bolton-le-Sands, near Lancaster, was opened a week ago.

New offices have been erected for the Parish Council of Brechin. The design is a free treatment of Scotch Renaissance. The whole work has been carried out from plans prepared by Mr. D. Wishart Galloway, architect and surveyor, Brechin.

There has been unveiled in the Kremlin, at Moscow, the colossal statue of Czar Alexander II., which stands nearly 18ft. high, under a canopy of red Finnish granite. Nine years ago, Alexander III. approved of the design for the statue, and now he also has gone, and it is only the grandson of the great Czar Liberator who can be present at the inauguration of a monument of truly Russian splendour.

The new works of the City and South London Railway have very nearly cleared the river on the south side of London Bridge, and a junction is about to be effected with the existing line at a point a little to the north of St. George's Church—a point about 200yds. on the City side of the Borough station. By the time the station underneath the Church of St. Mary Woolnoth has been constructed, the tunnelling will probably have crept up from the north bank of the river to this point.

New Theatre at Kennington.

SUBURBAN playhouses are springing up on every hand. Already the outlying theatres furnish a very considerable list. The foundation-stone of the new house in Kennington Park Road was laid last week. Designed by Mr. W. R. G. Sprague, the new house will be one of the most complete and sumptuous in London, and may even eclipse most of the West End theatres—no very difficult task, by the way. It will occupy a site having frontages of about 80ft. in Kennington Park Road, 150ft. to South Place, and 90ft. to De Laune Street. The whole of the main frontages will be executed in white Portland stone; the elevations are of a rich Italian Renaissance character; and the more expensive parts of the house will be entered from Kennington Park Road by a few broad steps running the entire length of the 50ft. wide stone colonnade, into a vestibule or lobby, and thence to the grand crush room. This apartment will be:

ONE OF THE FEATURES

of the building, having a length of 42ft. and a width of 22ft. The walls will be of a specially selected Italian marble, and recessed marble columns will add to its beauty, whilst specially designed and deeply recessed fireplaces at each end, will add to the general comfort and luxury. From this crush room will run a bold marble staircase, 27ft. wide, branching off on each side to the dress circle, with a separate and direct entry to each of the stalls. Directly above the main crush room will be a ladies' foyer and the grand saloon, both these apartments being quite separate, and the style of decoration throughout the interior will be French Renaissance, with a free introduction of paintings on ceilings and panellings, whilst the draperies and colourings will be of harmonious and soft tints, with a free use of gold, so that the utmost effect of richness and harmony may be obtained without the making of any one

COLOUR OBTRUSIVE.

The auditorium will have an average depth of 70ft. and a clear width of 60ft., and constructed on the two-tier system, viz.: Stalls, pit stalls on the ground floor, dress circle forming the first tier, or balcony, and the gallery and amphitheatre being the second tier. The decoration of the auditorium throughout will be of the richest description, and the electric light will be employed. Exceptionally large and richly decorated saloons are adjacent to each part of the theatre, the pit saloon having the walls entirely covered by fancy tiling. The retiring rooms have received special care, and will be found as perfect as modern science can make them. Heating and ventilation will be conducted on the plenum system, and fresh air of the required temperature will be distributed by flues and channels to the different parts, the foul or used-up air being gently forced out

THROUGH POWERFUL EXHAUSTS.

A complete set of hydrants and fire appliances is arranged, and the stage will be fitted with a special double asbestos and steel fireproof curtain, controllable by one man. The stage is one of the largest in London, being about 80ft. wide and 50ft. deep. The electric light will be generated by steam plant, and will be of sufficient power to give any possible electrical effects at the pantomime season without diminishing the normal light of the house. The dressing rooms are entirely separated from the stage by stout brick walls and iron doors. Large scenery stores, painting rooms, and property rooms, &c., are included in the scheme, and Mr. Sprague hopes to have the theatre ready by November.

THE plaster cast of the life-sized marble statue of the late Judge Thomas Hughes, the author of "Tom Brown's Schooldays," which is to be erected by Old Rugbeians and others at Rugby, has now been completed and approved by the Memorial Committee. Mr. T. Brock, R.A., who has been entrusted with the work, is therefore now busily engaged upon the execution of the statue itself.

A NEW NORTHERN SHIRE HALL.

A NEW Shire Hall has been erected at Durham. It was formally opened last week. The new building is a conspicuous adornment to the fine thoroughfare of Old Elvet, and indeed to the ancient city in which it is situated. Unfortunately, the site upon which it has been erected stands somewhat in a hollow, and its shape is also peculiar, forming as it does almost an equilateral triangle. However, the difficulties presented by these circumstances have been well overcome by Messrs. Harry Barnes and Fredk. E. Coates, A.R.I.B.A., of Sunderland and West Hartlepool. Standing, as the Hall does, upon rather low-lying ground, and overlooked as it is from many parts of the city, the architect's decision to grace the building with

A TOWER AT THE CORNER

has been abundantly justified in the result. The tower, which is capped by a dome of beaten copper supported by a drum of clustered shafts, not only gives the building greater prominence among the surrounding erections, but adds appreciably to its dignity. Ruabon red terra-cotta is the principal material used in the fine new building, the appearance of which is further enhanced by its roofing of Westmoreland green slates. Around the entire length of the Hall, which has a frontage of 200ft., runs a balustrade. In the centre is the main entrance, through an elaborately enriched archway, approached by a fine flight of Mansfield stone steps some 30ft. in width. The grill is

RICHLY WROUGHT IN HAMMERED IRON,

after passing which is seen the grand staircase. Its steps are of marble, while the balustrade is of terra-cotta, and the supporting columns of polished white Parian. All the corridor floors are "fireproof," and laid with wood blocks. Upon the ground floor the council chamber and committee rooms and the offices of the county clerk are found. The council chamber—one of the most interesting portions of the new structure—is on the axial line of the building, and, though effectually isolated, is of easy access from all parts. Its shape is that of a horse-shoe, perhaps the ideal form of a council chamber; all unnecessary corners, &c., are dispensed with, rendering the acoustic properties almost perfect. At a great height from the floor, the horse-shoe makes a transition to a circle, the roof being neatly coved and domed, with pendentives and

ARCHES ORNAMENTED IN RELIEF.

The walls are adorned with marble columns, panels, and carving, and each of the windows is filled with stained glass representing the arms of the county and of a number of the different boroughs in the Palatinate. Accommodation is provided for 100 members, in addition to the officers and Press. Much attention has been paid to the position of the ante-room, which is hexagonal in shape, and handsomely decorated with rich oak panelling, while the waiting rooms are well placed for the convenience of deputations. On either side of the principal entrance are to be noticed the County Clerks' departments, and the first floor contains the offices of the County Surveyor, Medical Officer, Accountant, and Technical Education Secretary, all the departments being self-contained, while the second floor is devoted to photographing rooms, laboratories, and a library. Excepting the council chamber, which is heated on the Plenum system, the building is warmed by low pressure steam; but all the principal offices have open fires. The original estimate was £18,081, but, this amount being considered too high, the architects, at the desire of the Council, reduced it to £13,875, which sum was accepted. The contract for the whole building was entrusted to Messrs. D. and J. Ranken, of Sunderland; Mr. J. G. Kilburn, of Durham, being appointed clerk of works, and Mr. J. E. Miller, A.M.I.C.E., of Sunderland, quantity surveyor.

Professional Items.

ASTON.—New cottage homes are being erected at Gravelly Hill, Birmingham. The architects' plans were originally drawn for the accommodation of "families" of thirty, but at the instance of the Local Government Board they have been amended, so as to provide for "families" of not more than sixteen, space being found in the altered designs for a total of 250 children. The new buildings face the workhouse on the opposite side of Union Road, and are divided by a broad roadway into two sections, one for girls and one for boys. In the centre of the former is situated the superintendent's house; at the Fentham Road end is a probationary lodge for the detention and examination of new comers, and at the opposite extremity are the church and schools and the infirmary. In each section are seven homes for the accommodation of sixteen children each, and one for twelve children. The boys' department contains workshops. The contract, which amounts to £42,000, has been let to Messrs. W. Lee and Son, of Aston.

BARNESLEY.—The Barnesley Corporation is about to erect an isolation small-pox hospital. The building, which is from the plans of Mr. J. F. Taylor, C.E., borough surveyor, will consist of five blocks of buildings, viz., entrance and discharge block, isolation block, administrative block, main road block, laundry and disinfecting block. The isolation block will comprise male and female wards, with nurses duty rooms. The administrative block will be three stories in height, with a water tower in the centre, and will contain dispenser's room, waiting room, matrons and nurses dining, sitting, and bedrooms, &c. The main ward block includes male and female ward, each 36ft. by 26ft., and two wards for the treatment of special cases, &c. The walls are to be of brick, relieved by mouldings, and stone dressings, the character architecturally being domestic Gothic. The lighting will be by oil lamps temporarily, and afterwards by electricity. The lighting and ventilation of the building is on the latest principle. The tenders, amounting to £5990, accepted, are as follows:—Mason and brickwork, Messrs. J. and C. D. Potter; joiner, J. Smith; glazier, plasterer, Fleming; slater, Messrs. Dauber and Son, Limited; plumber, glazier, smith and founder, B. Dennison; hot water engineer and painter, Messrs. Snowden and Son; disinfectant and laundry engineer, Manchester Laundry Engineering Company.

BRISTOL.—For several months past preparations have been in progress at the Bristol Electrical station for the supply of the power that will shortly be needed to feed the extended mains. The capacity of the engine room has been more than doubled, and the number of Lancashire boilers has been increased from seven to twelve. In the course of a few months there will be machinery of between 4000 and 5000 horse power in the engine room, and in the extension of the building recently carried out by Mr. C. A. Hayes, from the designs of Mr. Henry Williams, room has been provided for further additions to the plant when they become necessary.

DEVONPORT.—Structural and other alterations have been carried out at the Metropole Theatre, Devonport. The principal improvement is the formation of a grand circle with seating accommodation for 350. This has been done by bringing forward the gallery 20ft., in horse-shoe shape, with a frontal of fibrous plaster, artistically decorated. The other alterations include the provision of a much-needed ladies' cloak-room, and a rearrangement of the accommodation at the back of the pit, to improve the view of the stage. The ceiling has been treated to represent the four seasons of the year, the central panel being an artistic study illustrative of a rehearsal. It is proposed to erect a balcony in Catherine Street, and otherwise to improve the appearance of the arcade, which will be lighted by clusters of electric globes.

EDZELL.—The formal opening of the Inglis Memorial Hall, Edzell, took place a few days ago. The hall is a fine architectural group with graceful proportions and harmonious lines. Granite shafts and Venetian enamel mosaic have been utilised with effect on the porch. Over this rises the clock tower. The style used is Scottish of the sixteenth century. The works have been executed by the following contractors: Messrs. J. Ford and Son, Montrose, mason work; Messrs. W. Black and Son, Brechin, joiner work and library fittings and furnishings; Mr. J. Scott, Brechin, slater work; Mr. D. McKay, Carnoustie, plumber work; Messrs. Thomson Brothers, Brechin and Edzell, plaster work; Messrs. McKenzie and Moncur, Edinburgh, heating; Messrs. Milne, Edinburgh, gas fittings; Messrs. Alexander, brass founders, Dundee, hall pendants; Messrs. Wooliscroft, Hanley, wall and floor tiles; Messrs. Salvati, Venice, Messrs. Meikle, Glasgow, and Mr. Fox Maule Boyd, Dundee, have respectively carried out the Venetian enamel mosaics, stained glass and painter work to special designs by Mr. C. Ower. The architects were Messrs. Ower.

GLOUCESTER.—In a limited competition, the designs of Mr. Alfred J. Dunn, A.R.I.B.A., of Gloucester and Birmingham, have been selected by the professional assessor for new schools to accommodate 950 children, for the City of Gloucester School Board. The following report was made by Messrs. Martin and Chamberlain, the appointed referees:—"In accordance with your request, we now have the pleasure of sending you a copy of the notes made by our Mr. William Martin and his son, Mr. F. Martin, upon the inspection of nine designs sent by six competitors for schools to be erected on the Sandpits site, and of the particulars accompanying the same, and are of opinion that the design marked 'Complete Supervision' is the best, and that designs marked 'Sinister Lux' and 'Up-to-date' No. 1 are equal second. At the same time, we would suggest that the attention of the author of the selected design be called to the points named in our report upon his design for his re-consideration, and we assume that our remarks upon the other designs will be for the consideration of the committee only, and not to be made public."

LEEDS.—The newly-erected mission Church of St. Andrew, Stourton, Leeds, was consecrated a few days ago. The new church is designed in the Decorated style of English Gothic Architecture, and consists of a nave of five bays, aisles, and chancel, with a chapel on its north side, and organ chamber and vestry to the south. The church is built of brick—the walls plastered inside—with external dressings of red Dumfries stone and Harehills stone internally. Both nave and chancel have a somewhat lofty clerestory, that of the nave carrying an open framed roof, 51ft. to the apex, while the chancel roof is panelled to a curve. The chancel end is lofty and wide, so that the full sound of the organ can be heard well in the nave. The organ chamber itself is raised about 10ft. above the choir level, so that the organist has full command of his choir. The chancel is well raised above the nave, and seated in oak for a fairly large choir. The altar stands partly in a recess formed by the jambs of the great east window being brought down to the ground. The chancel still lacks its screen and other permanent furniture, while in the nave the pulpit and font are both temporary, having been used in the old iron church. Mr. W. T. Gould, of Leeds, has been the sole contractor. Mr. T. A. Bolton has been the clerk of works, and Mr. C. Hodgson Fowler, F.S.A., of Durham, the architect.

LLANDRINDOD.—The Gwalia Hotel has been extended by the addition of a separate block of buildings. The new Gwalia has been designed in the English Renaissance style of Architecture. It occupies one of the most prominent sites in Llandrindod, the principal façade fronting what has appropriately been termed the Gwalia Square, the other elevations facing the park and Ithon Road respectively.

At the intersection of the frontages octagonal turrets are placed, these being carried up to the main roof, and surmounted with an ornamental covering. The decoration and ornament have been centred on the main façade, where some very excellently carved panels and shields provide a pleasing effect. Red Ruabon bricks have been used throughout the building, with Bath stone dressings. The internal arrangement of the various floors are admitted to be not only unique, but excellent in every respect. The corridors throughout the building are well lighted and ventilated. The rooms are well arranged, ample in dimensions, and readily accessible. The chief feature, internally, is a spacious central hall, luxuriously furnished, and rendered attractive by stained glass windows, mosaic floor, artistically draped arches, the grand staircase with handsome walnut newel surmounted by a wrought-iron electric light standard, and the balconies with their fairy pendant hangings on the first and second floors, overlooking the central hall. The contract has been carried out by Mr. D. Jenkins, of Swansea. The new hotel was designed and carried out under the supervision of Messrs. Swash and Bain, architects, Newport (Mon.). The total cost of the building, including land, &c., has been £15,000.

LONDON, N.—A new police-court for the Highgate district, which has been built at the corner of Archway and Bishop's Road, quite close to the Highgate Railway Station, was formally opened last Tuesday week. The new building which has been erected by the Middlesex County Council, at a cost of about £6000, occupies a site opposite to the Gravel Pit Wood, which cost £5000, half of which will be refunded to the county by the Commissioner of Metropolitan Police, as half the ground is to be occupied by a new police-station. The building, the foundation stone of which was laid on August 5th, last year, is of red brick, with stone dressing.

NEATH.—The foundation stone of the Gnoll Park Road Board Schools has been laid within the last few days. These are the first schools that have been erected by the Board, and will have accommodation for nearly 1000 children. The work is being carried out by Mr. David Jenkins, builder, Swansea, at a cost of £10,700, from competitive plans supplied by Mr. J. Cook Rees, architect, of Neath.

PLYMOUTH.—All Saints Church, Tor, Plymouth, which has been closed for nearly three weeks, is now opened. Various alterations have been effected. Two new stained glass windows which have been put in the apse add very greatly to the general effect of the chancel. One window represents the Apostles St. James and St. John, with typical scenes from their lives; the other shows St. James-the-Less and St. Matthias in similar manner. A new pulpit of green Chilwork stone has been erected in the place of the temporary structure.

SHEFFIELD.—During the last few weeks extensive structural alterations have been in progress at the Sheffield Theatre Royal, Mr. Frank Matcham having supervised the work. A handsome verandah has been erected, covering the whole of the frontage and the gallery entrance at the side; whilst the walls have been cemented with rusticated work, bold mouldings, and ornamentations. New lobbies and vestibules have been provided, with mosaic flooring and ornamental ceilings, the walls being panelled with mouldings and enrichments, and ornamented with artistic figures, paintings, and tapestries. The staircase to the dress circle has been widened, and the wall and ceilings ornamented in harmony with the grand vestibule. The staircase opens into a large foyer, which leads to the dress circle, and adjoining is a lounge, which opens on to the saloon. A great improvement has been effected in the seating and accommodation of the stalls, and for this purpose a wide staircase has been erected. At the auditorium side an improved exit has been formed into the side street. The theatre has been redecorated throughout from the designs of the architect.

Under Discussion.

ARCHITECTURAL VISIT TO PLYMOUTH.

A large gathering of members of the Plymouth Architectural Society recently assembled at the Palace Theatre, which is now rapidly approaching completion in Union Street. The party were met at the entrance by Messrs. J. T. Wimperis and Arber's representative, Mr. Sprague, who conducted them over the works and explained the general arrangements of construction, of seating, and the decorations. After the auditorium had been inspected the party viewed the stage, and here all the mechanism was closely examined, together with some of the scenery, which was hoisted for the inspection of the members. The upper regions of the stage and the "gridiron" occupied attention en route. On the conclusion of the visit Messrs. J. T. Wimperis and Arber, the architects for the building, and Mr. Sprague, their representative, were heartily thanked on the proposition of Mr. E. A. Lethbridge, seconded by the hon. secretary, Mr. B. Priestley Shires.

ROYAL ARCHÆOLOGICAL INSTITUTE.

The members of the Royal Archæological Institute paid a visit to Lancaster last week. Among the excursions taken was one to Heysham. The church, dedicated to St. Peter, the party found to be of Norman architecture, with remains of Saxon work. In the churchyard several ancient tombstones were pointed out, on one of which is a carved cross with a sword on one side and a harp on the other, conjectured to have been the memorial of a minstrel warrior. An object of archæological interest is found on the right hand side of the path, this being a stone known as the Heysham Hogback, which is most curiously carved. On the headland to the west of the church were seen the ruins of the oratory of the little Saxon church which was dedicated to St. Patrick, and which measured 27ft. by 9ft. The parts remaining are the east wall and parts of the north and south walls. To the west of this church six coffins hewn in the rock were pointed out, and these were seen to have sockets at the head for crosses which have disappeared. On the opposite side of the hill are two similar coffins, one a small one, apparently that of a child. This is taken by some antiquaries to refute the proposition that the place was ever the cell of an anchorite or missionary hermit, whilst others deny that it does, as many of them were married men. The generally accepted tradition is that it is an early British church founded by St. Patrick, who landed on the shores of Morecambe Bay from Ireland.

A VISIT TO YORK.

The members of the Northern Architectural Society, which is one of the largest of the provincial centres in alliance with the Royal Institute of British Architects, recently paid a visit to York. The party was conducted by Mr. John Robson, Newcastle-on-Tyne, and Mr. Arthur Pollard, York, over the new north wing recently added to the Station Hotel by Mr. William Bell, the company's architect. One of the chief features of this additional block of buildings is the magnificent reading and writing room, which will supply a long-felt want as a source of comfort and convenience to visitors. This work has been carried out entirely by Mr. Robson, being finished throughout in oak. The furnishings and appointments are luxurious, and every modern contrivance in the way of electric lighting and efficient ventilation has been studied. The party visited the following places of interest under the guidance of the president and hon. secretary of the York Society, viz., All Saints, North Street, the Guildhall, St. Leonard's Hospital, St. Mary's Abbey, and the Yorkshire Philosophical Society's Museum, the King's Manor House, King William's College, Stonegate, the Shambles, and the Merchants' Hall, Fossgate. A dinner was afterwards held at the Station Hotel.

SHAKESPEARE'S CHURCH.

THE WORK OF RESTORATION.

WE have already summarised in occasional paragraphs the work of restoration as it has proceeded at the Collegiate Church of the Holy Trinity, Stratford-on-Avon. Now that another stage in the work has been reached, ampler details may be of interest. Unfortunately, what was proposed to be carried out when the work was first commenced has not been realised. After spending about £6000 upon the building some few years ago, operations were suspended for a time to allow of the liquidation of some £200 or £300 of the debt which remained, but in the autumn of last year, the liability having in the meanwhile been cleared off, public attention was once more directed to the desirability of completing

THE WORK IN THE NAVE,

and of restoring and beautifying the church in other respects. Under the advice of Mr. G. F. Bodley, A.R.A., whose name the committee felt would inspire confidence in all who regarded "Shakespeare's Church" in a certain sense as the property of the nation, a scheme was formulated for continuing and, it was hoped, finally completing the work. It was proposed to relay the floor of the nave and transepts, scrape the walls and columns under the tower, and substitute oak open benches for the uncomfortable pews put in about fifty years ago, when upwards of £10,000 was spent upon the church; also to introduce new heating apparatus and reconstruct the organ, which, as an electric instrument, had proved a failure. The scheme also comprised the rebuilding, on a revised plan, of

THE OLD VESTRY,

taken down about one hundred years ago on account of its dilapidated condition. For the whole of this work (including a proposed installation of the electric light) it was computed that £5000 would be required, and although little doubt was felt at the time as to the raising of the money, yet it was thought advisable to proceed cautiously and give preference to the more pressing portion of the work. This included the relaying of the floors, which, owing to the large number of burials inside the church, were in a very insanitary condition. Interments have taken place continuously for upwards of 800 years until within a comparatively recent period, and the earth under the floors—especially in the south transept—was positively wet. In addition, there were a large number of vaults inside the building which were a menace to health. The ground had been excavated to a considerable depth, the vaults filled in, and a good foundation of rubble and concrete put down. Upon this have been laid oak blocks for the pews, and the gangways and centre aisle have been paved with stone, in which have been inserted

ALL THE ANCIENT MONUMENTAL SLABS discovered buried beneath the modern floor. During the excavations a large quantity of human remains were found, together with a

few relics, moulded stones, &c., belonging to the original monastic church, which occupied the site before the Norman Conquest. In making an opening at the head of the south aisle into the transept an interesting relic was brought to light, consisting of an Early English lancet window, which had been blocked up nearly 600 years. The mouldings were a good deal mutilated, and for this reason Mr. Bodley could not advise that the window should be retained. The relaying of the floor has been carried out by Messrs. G. F. Smith and Sons, Milverton, at a cost of about £1300. An improved apparatus for heating the church by means of hot air has been introduced by Mr. J. Grundy, of London, costing nearly £400, and Messrs. W. Hill and Sons have reconstructed the organ, upon which, including the case, nearly £2000 was expended a few years ago. The electric system then introduced has been discarded, and the builders' tubular pneumatic action substituted. The arrangement of the instrument is remarkable and unusual, owing to the difficulty of disposing of it without obscuring any essential feature of the church. The swell organ is placed in the beautiful loft or gallery over the tower arch facing the nave; the great and pedal organs stand behind the carved oak screen at the east end of the south aisle; the choir organ projects into the south transept; while the blowing feeders and engines occupy a convenient site below the great window of the south transept, and are disposed of behind a suitable oak screen. The console for the player stands behind the choir seats in the nave, and though the length of action to the swell is great the utmost rapidity of touch is maintained, and the entire mechanism is of a very scientific and beautiful kind, being instantaneous, light, and noiseless. It is considered one of the finest church organs in the kingdom.

NEW CLERGY AND CHOIR STALLS,

designed by Mr. Bodley, have been promised by the vicar, but these will probably not be fixed before the autumn. In the meantime a temporary structure has been set up. The aisles have been seated with handsome oak benches, with suitably carved ends, and it is hoped eventually to fill the nave with the same kind of seating; at the present time the nave and transepts are provided with chairs. A substitute for a pulpit is a plain wooden structure, which has been in use since the stone pulpit was discarded by the vicar some years ago. The gift of a new pulpit in keeping with the Architecture of the building is much desired, and it is hoped will soon be supplied, as the present erection is both shabby and insignificant. Excluding gifts, the work carried out during the past six months and that sanctioned has cost over £3000, and some £2000 more is needed to complete the scheme, including a new vestry and other work; but as the committee are already considerably in debt, the remaining portion has been postponed.

It is proposed to build a free library at Chorley. The architects are Messrs. Jolly, Buckley, and Dinsley, of Chorley.

Correspondence.

CARSHALTON COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In answer to Messrs. Newman and Newman's letter in your issue of July 20, permit me to express my regret for having mistaken their connecting roads and paths for covered ways. My criticism on the disposition of their buildings will, however, still hold good. My remarks on the size of two of the block plans were owing to the fact that eight out of the ten competitors restricted their strainers to one uniform size. Messrs. Newman and Newman's explanation does not elucidate this point, for permission to show only a part of the site seems rather to imply that the uniform size of strainers was intended to be maintained. Such was evidently the interpretation that eight of the competitors gave to the Board's instruction.—Yours faithfully,

THE WRITER OF THE ARTICLE.

Enquiry Department.

"ARCHITECTURAL PERSPECTIVE."

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am about to take up architectural perspective. Would you kindly, in your next issue, give me name of best book on ordinary every-day architectural perspective? and oblige, yours truly,

"IMPROVER."

The best work for students is "Linear Perspective," by G. A. T. Middleton, A.R.I.B.A., published by B. T. Batsford, 94, High Holborn, W.C., at 1s. A rather more advanced work is "Architectural Perspective," by F. O. Ferguson, 3s., same publisher. "Linear Perspective" is, of course, the method usually employed by architects.

Trade and Craft.

THE THRELKELD GRANITE CO. LTD.

The Threlkeld Granite Co. Ltd., of Keswick (Cumberland), have been awarded a silver medal at the Royal Lancashire Agricultural Show held at Blackburn, and have received similar recognition at the Wirral and Cheshire Show held at Birkenhead, for the excellence of their manufactures in ornamental granitic tiles and granite concrete flags, &c.

WHILST making some excavations at the Rock House Hotel, Barton, near Manchester, which is being rebuilt, the workmen have found a skeleton in a stone aperture underneath the floor in the old kitchen. A gold ring was found in the grave.

EXTENSIVE rebuilding and enlargement works of the premises of the Dental Hospital in Leicester Square are now in progress.

A NEW hospital for soldiers' wives and children has been opened at Aldershot. The hospital, which is a yellow brick building, is named the "Louise Margaret" Hospital, after the Duchess of Connaught.

ALTHOUGH buildings occupied exclusively by societies for the purposes of Art and Science are wholly exempt from assessment, the Treasury proposes to pay rates and taxes upon the Tate Gallery at Millbank, provided the parish of Westminster is prepared to approve of the valuations made by the Treasury valuer, which is £12,300 a year.

THE memorial to the late Duchess of Teck, at St. John's Church, Kingston Vale, which was dedicated on Saturday, is in the form of a beautifully-carved reredos in white alabaster from the designs of Mr. C. F. Bodley, A.R.A., and four stained-glass windows, with the figures of the patron saints, St. George, St. Andrew, St. David, and St. Patrick.

CONTRACTS OPEN.**CLACTON COTTAGE HOSPITAL.
DIAMOND JUBILEE MEMORIAL.
TO BUILDERS AND CONTRACTORS.**

The Committee invite TENDERS for the ERECTION and COMPLETION of a COTTAGE HOSPITAL at Clacton-on-Sea. Plans and specifications, with bills of quantities, may be obtained of the Architect, Mr. J. W. MARTIN, Station-chambers, Clacton-on-Sea, and No. 17, Coleman-street, E.C., for which a deposit of £1 1s. will be required, to be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Tender for Cottage Hospital," are to be sent to the undersigned not later than TWELVE o'clock noon on SATURDAY, AUGUST 6th, 1898.

The Committee do not bind themselves to accept the lowest or any Tender.

July 20th, 1898.

PARISH OF NOTTINGHAM.**TO BUILDERS AND CONTRACTORS.**

The Guardians of the Poor of the Parish of Nottingham are prepared to receive TENDERS for the ERECTION of the SUPERSTRUCTURE of the new WORKHOUSE, INFIRMARY, and appurtenant Buildings, for 1600 inmates and staff at Bagthorpe, in the City of Nottingham.

Instructions for Tender, and forms of Tender and bills of quantities can be obtained from Mr. ARTHUR MARSHALL, A.R.I.B.A., of King-street, Nottingham, on payment of £21 to me, the undersigned, for each copy, after which the drawings and specification can be inspected at the Architect's office during the usual hours of business.

The amounts deposited will be returned on receipt of bonâ-fide Tenders.

Tenders and accompanying documents, completed in accordance with the instructions attached to the form of Tender, must be delivered in a sealed envelope,

endorsed "Tender for new Workhouse," not later than TWELVE o'clock on SATURDAY, AUGUST 6th next, at my office in Shakespeare-street, in the City of Nottingham, after which hour no Tender will be received.

Any Tender not made in the prescribed manner, or not completed in every particular, in accordance with the instructions, will be rejected.

The person whose Tender is accepted will be required to enter a bond with two approved sureties for the performance of the contract.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order of the Guardians,
G. MUNCASTER HOWARD,
Poor Law Offices, Clerk to the Board.
Nottingham.
June 30th, 1898.

**BOROUGH OF SHOREDITCH.
NEW BATTERY ROOM, BOILER HOUSE,
AND EXTENSION OF OFFICES.
CONTRACT No. 18.**

The Shoreditch Vestry invite TENDERS for the ERECTION of a new BATTERY ROOM, BOILER HOUSE, and EXTENSION OF OFFICES at the Electricity Supply Station, Coronet-street, Shoreditch.

Specifications, quantities, and forms of Tender can be obtained, and the drawings can be seen at the Offices of the Engineers, Messrs. KINCAID, WALLER, and MANVILLE, 29, Great George-street, Westminster, on payment of a fee of Three Guineas, which sum will be returned on receipt of a bonâ-fide Tender.

The Vestry do not bind themselves to accept the lowest or any Tender, and the contractor whose Tender is accepted shall enter into a formal agreement under seal with sufficient sureties for the due fulfilment of his contract.

Trade Union rates of wages and hours to be observed. Sealed Tenders, endorsed "Electricity Supply, Tender for Battery Room, Boiler House, and Extension of Offices," to be sent at or before NOON on MONDAY, AUGUST 15th, 1898, to

H. MANSFIELD ROBINSON,
Town Hall, Vestry Clerk and Solicitor.
Old-street, E.C.

**SWANSEA U.D. SCHOOL BOARD.
TO BUILDERS.**

The School Board of the United School District of Swansea invites TENDERS for the ERECTION of the Manselton School, Swansea.

The plans may be inspected at the School Board Offices, Dynevor-place, Swansea.

Applications for specifications and bills of quantities to be made to the undersigned, or to the Architect, Mr. G. E. T. LAURENCE, A.R.I.B.A., 181, Queen Victoria-street, London, E.C., accompanied by Three Guineas, which will be returned on receipt of a bonâ-fide Tender.

All Tenders must reach the Clerk on or before MONDAY, SEPTEMBER 19th next, in a sealed envelope, marked outside "Tender for Manselton Board School," and must be accompanied by a schedule of prices, and by the names and addresses of two sureties for the completion of the work, in case the Tender is accepted.

The Board does not bind itself to accept the lowest or any Tender.

A. W. HALDEN,
Board Offices, Swansea, Clerk.
July, 1898.

COMPETITION.**BOROUGH OF PLYMOUTH.
STREET IMPROVEMENTS.****WIDENING OF TAVISTOCK-ROAD.**

The Special Works Committee of the Plymouth Town Council is prepared to receive from Architects DESIGNS for the ERECTION of SHOPS and DWELLING-HOUSES fronting Tavistock-road.

The Committee offer a Premium of £250 for the Design selected as the best, and the Premium will be awarded by a professional assessor.

The Designs are to be delivered at the offices of the undersigned not later than SEPTEMBER 24th next.

Instructions for competing Architects, plans of proposed building sites, and all further particulars can be obtained on application to

J. H. ELLIS, Town Clerk.
Town Clerk's Office, Plymouth,
July 20th, 1898.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"Iowa" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

GAS-WORKS MACHINERY.*

BY EDWARD ALFRED HARMAN, C.E.,
Gas Engineer to the Huddersfield Corporation.

INTRODUCTION—continued.

HERE, again, is a common fallacy, namely, that it is the lightness of the gas which raises the gasholders, after the manner of a balloon—holders constructed of huge framework! In a gasholder of 200ft. diameter, having 5in. water pressure, the weight of iron represented equals nearly 600 tons. It is necessary that the capacity of the hydraulic main should be of sufficient size to allow of all the pipes therein remaining sealed, in the event of the exhauster from any accidental cause ceasing work. In such a case the whole of the gasholder pressure would be at once thrown on to the hydraulic main, forcing the liquor contained therein up the dip pipes to the maximum amount of the resulting pressure. It is this maximum pressure that has to be provided for. A few years since exhausters were commonly driven by pulleys and leather belts, but now in many works they are driven direct from an engine fixed on the same bedplate. Of course, the best form of exhauster is that which runs as evenly as possible, and gives the steadiest gauge. It is apparent that any unsteadiness of the engine might produce any or all of the undesirable possibilities to be avoided. In designing the size of the exhauster it is not sufficient to take the daily maximum make of gas, and divide it by twenty-four hours and so obtain the hourly make. When the retorts are first charged the quantity of gas travelling forward is more than at any later portion of the process of carbonisation. The rapidity at which retorts are charged, both by machinery and with the inclined system, produces a sudden rush of gas, which is very heavy, and has accordingly to be provided for. The high temperature of the gas as it issues from the retorts has also to be kept under notice, on account of its larger volume at the higher temperature. Excessive speeds for the exhauster should not be adopted, as by so doing the already high temperature of the gas is increased. It seems to the author that circumferential velocity is the correct method for calculating the size of an exhauster, and a good average rate is about 800ft. per minute; that is at the tips of the so-called exhauster blades. Generally speaking, exhausters should not be constructed to pass more than between 200,000 and 300,000 cubic feet per hour. It is desirable, above that quantity, to put in another exhauster. The gas to be exhausted is unpurified, as the exhausters are generally placed at the outlet of the condensers. There is a large amount of tar, ammonia, and, indeed, all the other impurities which have to be extracted in the further processes. The tar will, generally speaking, lubricate the exhausters sufficiently, but at times it is found desirable to add thick creosote oil, or a little thin tar, for additional lubrication. Under any circumstances, it is undesirable to use cheap machine oil for this purpose. When the exhausters are used simply for the purpose of delivering pure gas at a considerable distance away from the works, which is exceptional, any good machine oil may be used; although even then it is an open question whether creosote oil is not the most advantageous for the purpose. The engines for driving the exhausters are of simple construction, but necessarily require to be of a strong character, as their duty is severe. Regarding the horse-power required for driving exhausting machinery, this varies according to the pressure and circumstances; and it is indeed very difficult to fix any approximate rule for the calculation. For many years makers of exhausters have been reproducing with few important alterations, the familiar form of machine; namely, that of the rotary type, consisting of an eccentric

barrel with a double slide. This is being very gradually improved upon. As regards the speed of exhausters, the general idea seems to be that unless they rotate with great rapidity, very perceptible oscillations are experienced in the vacuum.

GAS ENGINES.

In connection with gas-works machinery, a larger use ought to be made of gas engines. It is somewhat of an anomaly to be generating steam, necessitating powerful boilers, when there is such an ample supply of gas power always available.

PUMPS.

Pumps are required on gas-works for numerous kinds of liquids, of varying specific gravities, from light volatile spirits to almost solid matter, in the form of tar and pitch, the viscosity of which is frequently fatal to the working of ordinary pumps. Pumps frequently have also to deal with cotton waste, small pieces of coke, and finely divided matter which have got into the liquid in some mysterious manner. There are also great variations in temperature to be taken into account. Sometimes the liquids are below freezing point, and at others at a high temperature. The pumps in many places have to deal with canal water, containing every possible variety of suspended matter. In calculating the requisite pumps, the specific gravity of thick tar, pitch, &c., must be carefully allowed for, and not merely the 33ft. maximum for ordinary water pumps considered.

LUBRICANTS.

Perhaps as important a question as any in connection with gas-works machinery is that of the most desirable lubricants. In many places machines are subjected to considerable heat, the effect of which upon oils and lubricants generally varies. It is not simply a question of volatilisation or viscosity, but the question of the different residuals left from the oil has also to be considered. Much of the difficulty experienced with machinery has been due to insufficient lubrication and improper lubricants. In gas-works the coal and coke dust have to be considered, and the sulphurous and other gases attacking every portion of metal for which they have any affinity. It is absolutely necessary that every part of machinery not at work should be tallowed and greased to preserve it ready for future service. It is a common error in many works to consider that the machines only want overhauling and attention immediately preparatory to re-starting.

COAL STACKING.

Stacking coal by machinery has not yet been largely adopted in the United Kingdom. The unloading of boats by means of grabs, &c., has certainly made a distinct advance. Upon some of the London works there are magnificent installations of work of this character. In May last, at the Institution of Gas Engineers, Mr. Marshall, the engineer of the Danish Gas Company, described the new coaling apparatus he had erected at the Fredericksberg gas-works. The machinery consists of six cranes, with steel lifting grabs, each weighing 3 tons; the total dead weight with the load of coal being 5 tons. There are also automatic cars constructed to carry 2 tons, discharging the coal into bins. These six cranes easily hoist 600 tons per hour, or 100 tons per crane per hour. Assuming the cranes work a minimum quantity of 480 tons per hour, this would equal for a working day of nine hours a discharge of 4320 tons. Assuming the cranes to be at work six months in the year, or, say, 180 days, the total quantity of coal unloaded would be 777,600 tons. Mr. Marshall, however, does not anticipate, during the first few years at all events, that the annual quantity discharged would amount to more than 500,000 tons. The Temperley transporter is admirably adapted for use under certain conditions, where a system of overhead transportation is required. It was introduced some five ago, when the portable beam type of transporter was tried with such marked success by the Admiralty for coaling men-of-war during the Naval Manœuvres of 1893. Since that time, however, the Temperley transporters have not only been generally adopted

for this purpose by the British and other Governments, but they have been applied in a variety of new forms for many uses on shore, and they are especially found to offer distinct advantages over other appliances for special purposes. This is the case when a long outreach is necessary, and goods are required to be conveyed to a considerable distance from the lifting point. A special feature of the Temperley transporter is a carriage, or traveller, of simple, but ingenious design, working on an elevated truck, and provided with an automatic device by which the traveller is arrested and held stationary while the load is being lifted or lowered, and which also sustains the load while the traveller is moving. The operations of lifting, transporting, and lowering the load are effected by the simple action of hauling in and letting out a single rope. Any ordinary form of winch may be used for working the transporter. The travellers are made of numerous sizes and patterns, suitable to the work required of them. At the Midland Coal Company's wharf at Woolwich, this transporter is used for discharging the coal from steam colliers on to a coal stack, and into wagons. The plant consists of a hollow steel boom 83ft. long, suspended from a carriage which is traversed along the flanges of an overhead steel girder of 40ft. span, by means of an endless chain laid to a hand-crab. After being held in any desired position, the boom is made fast by guide-ropes, and remains stationary while the work proceeds. The automatic traveller used runs on a swinging track suspended from the boom. It is operated, as before indicated, by a single rope attached to an ordinary steam-winch placed in an adjacent building. The track is fitted throughout its length with steps 5ft. apart, at any of which the traveller can be arrested, and the load lowered and deposited without breakage, the entire operation being under the control of the man stationed at the winch. The transporter is capable of making sixty lifts per hour, and the quantity of coal usually lifted in each scoop is thirteen or fourteen hundredweight, representing a duty of about forty tons per hour. This type of transporter, which is largely used for stacking coal, &c., is made in sizes up to 100ft. in length, and to lift up to fourteen hundredweight.

COKE CONVEYORS

Coke conveying and screening by machinery are attended by many difficulties, the sharp, gritty nature of the material grinding the apparatus used. One of the best forms of coke conveyors in England which the author has seen is that designed by Mr. Henry Hack, M.Inst.C.E., of Birmingham. It is in use at the city gas-works, Swan Village, near Birmingham, and consists of a continuous bucket-chain, Hack and Piggott's patent. The coke is conveyed from the cellars of the retort house to the outside of the house, where it drops on to a conveyor placed at right angles, and is quenched. It is then carried up an inclined conveyor leading into a circular rotary drum placed at a suitable angle, composed of perforated plates having different size meshes. Underneath this screen are placed two railway wagons, into one of which the dust falls, and into the other breeze, whilst at the lower end is placed a third wagon, which receives the coke that has traversed the entire length of the screen, not having sifted through the meshes referred to. It will be seen that hand labour is not employed upon the coal from the time it leaves the pit, until it leaves the gas-works in the form of coke. On the Continent, one of the best designs the author has seen for coke quenching and conveying machinery is that by M. de Brouwer, of Bruges. It consists of a chain conveyor placed below the bottom row of retorts, the return chain of which is placed overhead in front of the ascension pipes, and is supported by brackets projecting from the buckstaves. The conveyor consists of a water trough composed of plates and angle irons, in which runs a skeleton conveyor. Light tramways, with endless rope systems, are also successfully employed for conveying coke.

(To be continued.)

* A paper read before the Society of Engineers, on June 6th, 1898.

Builders' Notes.

THE first sod of the Basingstoke and Alton light railway was cut one day last week by Mr. C. T. Ritchie, President of the Board of Trade. The line, which will be built by the South Western Company, will be the first of its kind in England to be constructed under the Light Railways Act. Its length will be about twelve miles, running through a purely agricultural district in North Hampshire, and it will connect the main line at Basingstoke with the Alton and Winchester branch. It will also eventually form a connection with the new Meon Valley line, thus making a more direct communication with Portsmouth. Messrs. Firbank are the contractors, and the actual cost of construction is expected to be about £4000 per mile.

At a special sitting of the Glasgow Dean of Guild Court a petition was heard from Mr. W. A. Wylie, Westburn Gardens, Kelvinside, on behalf of the Kirklands Trustees, for permission to erect a building of nine stories and basement in Waterloo Street, adjoining Corn Exchange. When the application was brought before the Court a few weeks ago objections were stated from the Bench in the public interest, as to the serious damage that would arise were fire occurring in such a building, there being no exit except by one stair, on both sides of which were hoists leading from the bottom to the top. The hoisting, it was stated, would act as a funnel in the case of fire. The Bench desired to call the attention of proprietors to the undesirability of such high buildings. The case was again adjourned.

MR. R. M. BEACHCROFT, of the Building Act Committee of the London County Council, has placed a motion on the paper suggesting that, "as the present system which obtains in London with regard to the supervision of buildings and the responsibility for their proper construction, both from a structural and sanitary point of view, is unsatisfactory," the Building Act Committee should report fully on the subject. An inquiry on the lines proposed should, if properly conducted, prove very useful. The investigation ought, however, to be an exhaustive one, and care should be taken to obtain the views of all concerned. A one-sided inquiry would be worse than useless, as it would tend to increase the dissatisfaction that already exists.

A CONFERENCE of representatives of the sub-committee of the Lancashire and Cheshire Building Trades Employers' Federation and the operative stone-masons has recently been held at Manchester, with the object of bringing about a settlement of the dispute between the masons and their employers. The dispute has lasted close upon three months, and in Manchester, Preston, Rochdale, Lancaster, Blackburn, Burnley, and Bury the men have been on strike; whilst in many other important centres in the two counties lock-out notices had been posted, in the event of no settlement being arrived at. In some towns the operatives have been on strike since May 1st, and in Manchester they ceased work on the 15th of the same month. The outlook was, therefore, most unpromising, and the delay in building operations at this period of the year, to say nothing of the threatened deadlock, was looked upon with dismay. There is, however, a prospect of a happier state of things existing as the result of this conference. Mr. R. Nield, Jun. (Manchester), President of the Employers' Federation, occupied the chair. The spokesman for the operatives was Mr. Crossman, Secretary of the Union. We understand that a rule with respect to worked stone was drawn up and accepted by both parties, and that, subject to details being settled locally, the dispute is at an end. We understand that, under certain conditions, the workmen agree to fix worked stone imported from another town, and that in Manchester and several other towns the wages will be advanced $\frac{1}{4}$ d. per hour, instead of 1d. asked for by the men.

Surveying and Sanitary Notes.

THE Croydon Corporation is desirous of sinking a well at Waddon for the purpose of giving the town an additional water supply. In order to do this it applied to the Local Government Board for permission to borrow £32,000, but when the inquiry was opened last year so much opposition was offered by certain Riparian owners on the river Wandle that the matter dropped. The Board has since, however, determined to reopen the inquiry, and last week Mr. G. W. ? and Dr. S. W. Wheaton sat for the purpose of taking further evidence on the subject.

BEFORE adjourning until the autumn, the Royal Commission on London Water Supply, of which Viscount Llandaff is chairman, held a sitting for the purpose of hearing further evidence on behalf of the water companies from Mr. Reginald Middleton, assistant commissioner to Lord Balfour's Commission, and one of the engineers of the Staines Reservoirs Scheme, who estimates that it would be possible to take 400,000,000 gallons of water daily from the Thames to supply the requirements of London, without reducing the flow over Teddington Weir below 200,000,000 gallons a day. It would be possible from various sources within a reasonable distance of the metropolis, including further wells that might be sunk in the chalk, to obtain 645,000,000 gallons of water a day, which would be sufficient to enable the companies to go on supplying for a long period. With such materials at hand, it was unnecessary to go to Wales.

A LEAKAGE recently occurred in the bed of the Kennet and Avon canal at Bath, at a point about half a mile from its junction with the river Avon. The water got into a culvert opening on the Great Western main line. Being much below the level of the canal, the line soon became partially flooded, and the drainage was totally inadequate to carry off the water. The torrent flowed up and down the line, and by nine o'clock was not far from Bath station, half a mile distant. The leakage was lessened somewhat by throwing into what became a whirlpool, boards and rubbish, but it is considered that it will be difficult completely to stop it as there is no lock near. The permanent way at the point of inundation has been already weakened, and trains have to pass at a slow speed. Not long since the banks of the same canal gave way four miles out of Bath.

THE Public Control Committee of the London County Council have received a letter from the departmental committee of the Home Office which is considering the questions of the manufacture and supply of water gas, asking for the opinion of the Council on the subject. The Public Control Committee now report that, having carefully considered the matter, they have come to the following conclusions, which they have communicated to the departmental committee:—(1) That considerable danger arises from the introduction of water gas in the process of the enrichment of water gas; (2) that non-carburetted and non-odorised water gas should not be allowed to be used under any conditions, since it is devoid of smell, which would give warning of any escape of the gas; (3) that 25 per cent. should be the maximum amount of water gas allowed to be introduced in the enrichment of coal gas, the proportion of water gas being ascertained by determining the amount of carbonic oxide in the enriched coal gas (coal gas enriched to this extent would correspond in poisonous character to the Dowson gas which is already in use for heating purposes and for gas engines, and would exclude the use of carburetted water gas); (4) that when it is proposed to supply poisonous enriched gas to houses and the interior of buildings a proper inspection be made of the service pipes by a responsible officer appointed by the local or other suitable

authority, who should certify that the pipes are in a sound condition and that there is no escape of gas, and that the cost of such inspection be borne by the gas company.

THE QUEEN publicly opened, last Saturday week, a new road at East Cowes which Her Majesty has presented to the inhabitants in exchange for a road in contiguity to the Royal demesne. The exchange has been the subject of protracted correspondence, and opposition has been raised by a section of the inhabitants. The Queen, however, has been most magnanimous in her treatment of the town, and, when it became known that the inhabitants would prefer an exchange in lieu of a sum of money for the purchase of a road which the Queen desired to include in her private estate, Her Majesty generously decided to give to the town a piece of land twenty-two acres in extent, lay it out, and metal it as a public highway and pass it over to the town free from encumbrance. The new road leads from Victoria Grove to Whippingham Road, thus furnishing a shorter thoroughfare between the two parishes. It is 500 yds. long and 50 ft. wide, and the land provides a space which can be used for recreation and other purposes. The road acquired by the Queen forms one side of the Oval, a name by which the neighbourhood has been locally known for many years past. The outer link of the oval comprises the public highway from Cowes to Ryde, and the side relinquished to the Queen, connected at each end with the main road by a short loop, reaches from the State entrance to Osborne grounds to that known as the Prince of Wales's Gate. It is not so long, and only about half as wide as the new road given in exchange, and, as it is a mere duplicate of the main road so far as it goes, it is of comparatively no value to the general public.

MR. JAMES GREEN, the valuer appointed by the Local Government Board, continued last week his inquiry as to the value of the land and buildings in the "betterment" area of the London County Council's Strand improvement scheme. The first case was that of the Strand Hotel Buildings. Nos. 1, 2, and 3 are freehold houses and shops, let on lease at £365 per annum, and containing an acre of 807 ft. Mr. Robert Reid, of Great Marlborough Street, estimated the present value at £540 per annum, and the value of the freehold in possession at £13,500, of which he fixed £2656 as the value of the buildings and £10,844 of the land. The five freehold houses and shops, Nos. 5, 6, 7, 8, and 9, Strand Hotel Buildings, containing an area of 1762 ft., are let on a lease at a rental rising from £610 to £700. Mr. Reid estimated the yearly value at £1050, and the value of the freehold in possession at £26,250, £5242 for buildings and £21,008 for land. No. 10, Strand Hotel Buildings, a house and shop, with an area of 393 ft., is let on lease at £140 per annum. Mr. Reid estimated the yearly value at £210, and the value of the freehold in possession at £5250, £1156 for buildings and £4094 for land. Mr. Andrew Young, the valuer of the Council, and Mr. G. H. Wilkinson valued the whole of the freehold property, Nos. 1 to 10, at £1205 per annum, and at twenty years' purchase, less deductions, at £23,815. The land they valued at £3 per foot—for 2992 ft., £8976. The leasehold house, shop, and buildings, No. 11, Strand Hotel Buildings, are held under a lease from the vicar and churchwardens of St. Giles, Cripplegate, for eighty years, from 1863, at a ground-rent of £85 per annum, and are under-leased to the Earl of Kilmorey for the whole term at a rental of £230 per annum. Mr. Reid valued the property at £380 per annum, and the freehold in possession at £9500. Mr. A. Young valued the lessee's interest at £1287. The last case was that of chambers over 39 and 40, Wych Street, the property of Mr. Wright. No evidence was offered for the claimant. The premises are leased for a term expiring in 1956 at £75 per annum, sublet for the whole term at £95. Mr. Young valued the lessee's interest at £202, and the freeholder's interest at £1628. The enquiry was then adjourned till October 25.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

IX.—WINDOWS.

(Continued from page lxxiv.)

CASEMENTS.—This term is applied somewhat loosely to all solid frames, but, strictly speaking, it should be used only to those in which the sashes are hung on hinges, like doors. When the frame contains mullions, and the sashes are in pairs, as shown in Fig. 141, it is called a French casement. In these frames all rebates, mouldings, &c., are worked in the solid, and the joints mortised and tenoned together. Fig. 140 is a vertical section; Fig. 142 horizontal section; Fig. 141 an inside elevation of a French casement, with the central pair of sashes hung to open inwards, the side lights fixed, and the fanlights hung at the bottom, opening inwards. The outside vertical members of the frame are called jambs, J, the inner ones mullions, M, the horizontal division a transom, T, the top member, the head, H, the bottom one, the cill, C, which is always made of some hard and tough wood, as oak or teak. As in other frames, the vertical members of the sashes are termed stiles, the horizontal ones rails. When the sashes open inwards much difficulty is experienced in making them weather-tight, as, of course, the pressure of the wind tends to open them. Many ingenious devices have been invented for the purpose, several of them being the subjects of letters patent. The methods shown in the drawings and the enlarged details (Figs. 143-146) have proved very effectual, but need good workmanship in the fitting; a $\frac{1}{2}$ in. projecting tongue is formed on the outside of the hanging stile, fitting easily into a corresponding groove in the mullion, which must be stopped at the cill to prevent

* All rights of reproduction reserved.

FIG. 141. A FRENCH CASEMENT. INSIDE ELEVATION.

access of water to the interior of the wall by way of the mortise. The meeting stiles are fitted with a peculiar joint, shown at N, Fig. 142, called a hook joint, and should be provided with double tenons to avoid end grain in the hooks. A watertight joint is secured at the cill by the use of Adams' patent water bar; this consists of an $1\frac{1}{2}$ in. brass bar extending right across the opening, and hinged to a casting fixed to the cill. When the sash is open, the hinged bar lies down nearly flush with the cill; as the sash is closed, a projecting spur in its bottom edge passes under the bar through a slot, lifts it up, and finally presses it close to the guard piece screwed on the outside of the sash. These casements are usually fastened by an espagnoletti bolt

extending the whole height of the sash, and fastening the door at three points by one turn of the handle. When the fanlight is to open, precaution must be taken against the ingress of water at the transom; two methods are shown at Figs. 143 and 145, in the former the light is hinged to the transom, and the joint is protected by an iron bar and the throating and weathering of the transom; in the latter, the light being hung at the top, there is greater risk of water getting in, and a gutter is worked in the transom to receive any that may drift in, which escapes by the copper tube shown in the dotted lines.

PIVOTED LIGHTS are sashes hung in solid frames upon centres or pivots either horizontally or vertically; the former are usually termed "centre-hung," and are used in lanterns, rear walls, and other inferior or inaccessible positions. They are actuated by cords, or geared metal rods. The pivots should be let into the frame a little above the centre, so that the lower part of the sash, being the heavier, shall keep shut by its own weight; the sockets are let into the sash and a path cut for the pivot through the face of the stile. This is covered by the portion of bead nailed to the sash when the latter is hung. To obtain the bevels for cutting the beads the sash is drawn at the angle it is desired to open it, with the beads in position above and below; at the points where the outer lines intersect with the same lines in a vertical position, draw lines in a direction away from the centre, at an angle of 45° , and those will represent the cuts.

Fig. 132A is an isometric sketch of the end of an oak cill, with the linings removed to show the method of trenching the pulley stile referred to on page lxxxiv. ante.

Fig. 133A is an enlarged detail at the cill in Fig. 132.

Fig. 134A is a detail of the boxing shown in Fig. 134.

Fig. 138A shows two methods of forming pocket-pieces, that at A showing the aperture in the middle of the stile, that at B cut through the inside. All the above illustrations should have appeared in the previous chapter, but were crowded out.

(To be continued.)

THE dispute in the building trade in the Ashton-under-Lyne district ended a few days ago, when the stonemasons resumed work at an advance of $\frac{1}{4}$ d. per hour.

THE Birmingham Corporation want to borrow £5000 in order to carry out a scheme of improved drainage for the low-lying portion of Balsall Heath between Balsall Heath Road and Edgbaston Road. The present drains are too shallow to effectively drain the district; hence the necessity for the present work.

WHAT IS A "NEW STREET?"

THE action of *Allen v. Fulham Vestry*, heard in the Queen's Bench Division before Mr. Justice Day and Mr. Justice Ridley, was a special case stated by a metropolitan magistrate upon the hearing of three summonses issued at the instance of the vestry of Fulham under section 226 of the Metropolis Management Act, 1855, on complaints that W. G. Allen and H. G. Norris had refused to pay £554 12s. 6d. and other appellants other sums apportioned on premises belonging to them in respect of the estimated expenses of paving a portion of Wandsworth Bridge Road called section 4, under section 105 of the Metropolis Management Act, 1855, and section 75 of the Act of 1862. The question mainly was whether this was a "new street" within the Acts, for if it were the vestry was entitled to apportion the expenses on the frontages. Wandsworth Bridge Road, of

FIG. 134A. DETAILS OF CASING.

which section 4 is part, forms a means of approach on the north side of Wandsworth Bridge. Such bridge, together with the said road, was made pursuant to the Wandsworth Bridge Act, 1864, by the Wandsworth Bridge Company in August, 1873. The road then ran through agricultural land, and was bordered by market gardens. By section 62 of that Act it was enacted that when the road was completed it should be

DEEMED A PUBLIC HIGHWAY,

and be repairable by the Fulham District Board of Works. In August, 1873, the road was made, but the Board thought it impracticable as a road, and refused to accept it. After protracted negotiations and litigation, however, an agreement was entered into on September 14th, 1876. Under it the Fulham

FIG. 132A. METHOD OF FITTING CILL.

District Board of Works agreed with the company, in consideration of the sum of £1750, to complete and put in repair the Wandsworth Bridge Road, and to make it in all respects fit for the purposes of a public highway within the meaning of the Wandsworth Bridge Act, 1864, and the Fulham District Board undertook the liability of repairing the said road as imposed upon them by the Wandsworth Bridge Act, 1864, and exonerated the company from liability. In 1877 the Board made up the carriage way with flints rolled in over a hard core. In the case of house-built streets the same method of making up was frequently adopted when the traffic was light. After twelve months the carriage way was

REPAIRED WITH GRANITE,

and this process had been repeated by the local authority down to the year 1897. No channelling or kerbing was done, except that the road was repaired in a permanent way and in the same mode and to the same extent as new streets with a similar amount of traffic

were dealt with. There were no buildings upon the land adjoining the road until 1890. In that year houses were erected on the east side. In the years 1895 and 1896 houses were first built on the west side. On February 24th, 1897, the vestry of the parish of Fulham, which is the successor of the Fulham Board of Works, passed a resolution that the road should be paved and the costs be apportioned on the frontages. It was proposed to pave it with wood blocks laid on a concrete foundation, which was more expensive than macadam. The magistrate found that the road was not originally laid out as a street. It was contended on behalf of the vestry that the said road became for the first time a new street when buildings were erected upon the land adjoining it, and that the vestry had when that was done power to require the adjoining owners to pave it. It was also contended that

WOOD PAVING WAS "PAVING"

within the meaning of the Acts of 1855 and 1862. It was contended on behalf of the appellants that it was a "new street" when it was made by the company, and that it having in 1877 and 1878, pursuant to the requirements of the vestry, been, with the exception of the flagging of the footpaths and of the channelling and kerbing of the carriage way, as well paved as streets with similar traffic were then required to be paved prior to their being taken over by the vestry. Under section 105 of the Metropolis Management Act, 1855, the vestry could not now say that it was not then a street. It was also contended that, assuming the vestry had power to require the road to be paved, it had no power to require the carriage way to be made up at the expense of the adjoining owners with wooden blocks laid on a concrete foundation. The magistrate held (1) that the road was not in 1877 or 1878 a "new street"; (2) that it became a "new street" for the first time after the erection of houses therein, and that it was a "new street" in February, 1897; (3) that the vestry was not prevented by anything done previously from requiring the road to be paved; and (4) that wood paving was paving within the Acts. The magistrates accordingly ordered the appellants to pay the vestry the sum mentioned in the summonses.—The Court upheld the magistrates' decision.

IN spite of the large powers conferred on County Councils to suppress river pollution, the evil still flourishes in many parts of the kingdom. But we may hope that the almost incredible state of things just represented in an official report to the Nantwich Rural Council has few parallels. Throughout the extensive area under the Council's jurisdiction, pollution appears to be the rule rather than the exception. At one place an artificial lake in a public park has become a reservoir for sewage; every time the dam is open, a black deluge pours through the outlet. In the same pleasant neighbourhood, a municipal sewage farm is incapable of absorbing the quantity deposited; with the result that the surplus "runs off in little rivulets." Next we read of a stream so polluted that it is "dangerous even to cattle," while the river Weaver is described as having reached almost the same condition. Finally, the Medical Officer of Health pronounces that "pollution is going on all over the Council's district," of course, to the endangerment of all human beings who are compelled to live there. Has no attempt been made, then, to ameliorate their insanitary surroundings? Not yet, apparently; the matter remains "under consideration," like the purification of the Lea and the Brent. The Cheshire County Council is credited with "having taken the matter in hand," while the Rural Council, after listening to the report, appointed a committee "to report as to the condition of various streams in the district." But neither of these august bodies has yet adopted any actual remedial measures; it will, perhaps, require some sharp outbreak of epidemic disease to convince them that systematic river pollution is a standing menace to public health.

Building on the Embankment.

AT last week's meeting of the London County Council the Building Act Committee submitted the following recommendation: "That the consent of the Council be not given to the erection of new Head Offices, with oriel windows, on the Victoria Embankment to abut at the rear upon Tallis Street, and flank upon Temple Avenue, and to exceed in height the width of those streets respectively, as shown upon the plans, submitted with the application of Mr. A. N. Bromley on behalf of the National Telephone Company Limited; as it is considered inexpedient to consent to the construction of the proposed projections

FIG. 133A. DETAILS AT CILL.

over the public way, to the extent shown upon the deposited plans, without the concurrence of the Corporation of the City of London." This was carried.

THE NEW OFFICES OF THE ASYLUMS BOARD.

The same committee further recommended: "That the consent of the Council be given to the erection of new offices on the Victoria Embankment, Whitefriars, at the corner of Carmelite Street, with the flank of the building to exceed in height the width of the street, as shown upon the plans submitted with the application of Mr. E. T. Hall, on behalf of the Metropolitan Asylums Board, such consent being subject, however, to the following conditions—that the new building be made in entire conformity with the letter of application, and as shown on the plans accompanying it, and be not at any time, in any manner, altered or raised without the consent of the Council; and that, if such plans or application be here-

FIG. 138A. TWO METHODS OF CUTTING POCKET

found to be inaccurate in any particular, the consent of the Council shall be null and void." This was passed.

UNSATISFACTORY MEANS OF ESCAPE FROM FIRE.

The committee, reporting on another application from the City, submitted the following recommendation: "That Mr. C. Thompson be informed that the Council, in the exercise of its powers under section 63 of the London Building Act, 1894, is not prepared to grant a certificate in respect of the means of escape in case of fire to be provided for the persons dwelling or employed on the top floor of 147, Queen Victoria Street, as shown upon the plan, dated June 24th, 1898, submitted by the applicant on behalf of Messrs. Babcock and Wilcox; as the plan showing the proposed means of escape is unsatisfactory, the construction of the building and the external balconies is not properly shown, and, moreover, no explanation is given as to how the persons on the top floor of the building would reach the ground."—This was adopted.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Aug. 6	Staple Hill—Police Station	Committee	M. H. Madland, 15, Clarence-street, Glasgow.
" 6	Clacton-on-Sea—Cottage Hospital	J. W. Martin, Station-chambers, Clacton-on-Sea.

Property and Land Sales.

HAMPTON AND SONS,

ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.

HAMPTON AND SONS beg to announce that their AUCTIONS of LANDED ESTATES, Town and Country RESIDENCES, INVESTMENTS, BUSINESS PREMISES, and other PROPERTIES are held MONTHLY at the Mart, Tokenhouse-yard, E.C.

Auctions can also be held on other days in Town or Country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.

List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to **HAMPTON AND SONS (LTD.)**, 1, Cockspur-street, S.W.; or by post, three stamps.

Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

SUSSEX.

SOUND LANDED INVESTMENTS.

SMALL SPORTING ESTATES, 13 FARMS, FULLY LICENSED INN, RICH MARSHES, WOODLANDS, ACCOMMODATION AND BUILDING LAND, COTTAGES, &c., being the outlying portions of the Sussex Estates of Sir James Duke, Bart., and extending to about 2750 acres, divided into numerous lots. They comprise:

Magham Down and Cottages in Hailsham and Hurstmonceux.

Amberstone Farm, Accommodation and Building Land in Hailsham.

Hempstead Farm and Building Land in Hellingly.

The Whyly Estate, East Hoathly, a capital sporting property, with grand coverts.

Squire and Tuett's Farms, Framfield.

The Merry Harriers Inn and 16 acres, Cowbeech.

Cowbeech House and Farm.

Beech Hill Estate, about 390 acres, of which 84 are wood. One of the most complete little sporting properties in the county.

Clippingham Farm, Hurstmonceux.

Straight Ditch Marshes in Pevensey Level.

Sandhill and School Farms and Marshes, Hoee.

Holmbush Farm, Hellingly, 85 acres.

Carter's Corner or Cowbeech Hill Farm, 46 acres.

Strood and Gatehouse Farms and Woodlands at Chiddingly.

Swansbrook Wood.

West-street Farm, Hellingly.

All the lands are let at fair rentals and mostly to tenants of long standing, and offer a good opportunity for the sound investment of capital in an improving security.

Many of the properties have long frontages and could readily be sub-divided or developed, there being a large demand for small residences in the district.

HAMPTON AND SONS

Will SELL the above valuable estates by AUCTION, in numerous Lots, at the White Hart Hotel, Lewes, on TUESDAY, SEPTEMBER 6th, at THREE o'clock precisely (unless previously disposed of privately).

Particulars and Plans of the Vendor's Solicitors, Messrs. PONTIFEX, HEWITT, and PITT, 16, St. Andrew-street, Holborn-circus, E.C.; of Messrs. DRAWBRIDGE and ANSELL, Estate Agents, Hayward's Heath, Sussex; and of the Auctioneers, HAMPTON AND SONS LTD., 1, Cockspur-street, London, S.W.

OFFICES: 1, COCKSPUR-STREET, S.W.

CLACTON-ON-SEA.

The rapidly rising and favourite Seaside Resort. The nearest Seaside Town to London on the East Coast, 95 minutes by rail from Liverpool-street. Fast trains and cheap season and residential tickets. Daily steamboat communication with London, Harwich, Ipswich, Yarmouth, &c., per splendid "Belle" steamboats. Southern aspect, gravel soil, good drainage. Important Sale of Freehold Building Land, Marine Residences, Shops, and Business Premises.

EDWIN J. GILDERS has been favoured

with instructions to SELL by AUCTION, at the Royal Hotel, Clacton-on-Sea, on SATURDAY, AUGUST 6th, 1898, at 8.30 o'clock in the evening:—

69 Plots of valuable FREEHOLD BUILDING LAND. Seven MARINE RESIDENCES.

Four SHOPS and valuable BUSINESS PREMISES, producing a rental of £410 per annum.

Particulars, plan, and conditions of sale of Messrs. CHAMBERLAYNE and SHORT, Solicitors, Donington House, Norfolk-street, Strand, London, and Clacton-on-Sea; Messrs. SAVERY and STEVENS, Solicitors, 2, Brabant-court, Philpot-lane, E.C.; Messrs. WITTEY and DENTON, Solicitors, Colchester; and at the Auctioneer's Office, 10, Union-court, London, E.C., and Clacton-on-Sea.

Westgate-on-Sea, proverbially one of the healthiest towns on the English coast, 1½ hours' journey from London.—Valuable sites in choice positions, suitable for the erection of marine residences.

MESSRS. ROGERS, CHAPMAN, and

THOMAS (in conjunction with Mr. R. Temple)

will SELL by AUCTION, at the Station Hotel, Westgate-on-Sea, on WEDNESDAY, AUGUST 31st, 1898, at THREE p.m. precisely, in lots, several PLOTS of LAND, commanding sea views, and others suitable for erection of detached and semi-detached residences of good character; also a few shop plots. Favourable opportunities are offered to gentlemen desirous of building to their own tastes in a select seaside resort, with excellent bathing, pure water, good train service, sheltered gardens, and public promenades. Arrangements can be made for payment by instalments.—Plans, particulars, and conditions of sale of Messrs. FARRER and Co., Solicitors, 66, Lincoln's Inn-fields, W.C.; of Mr. R. Temple, Estate Office, Westgate-on-Sea; and of the AUCTIONEERS, 50, Belgrave-road, South Belgravia, Gloucester-road, South Kensington.

FREEHOLD BUILDING LAND.—TO BE SOLD, a valuable BUILDING SITE, with extensive frontage to Lordship-lane, East Dulwich, and having an area of over 45,000ft. super. Suitable for the erection of a school or public building. Price £2000. Also several smaller plots, prices £140 to £600.—Plans and particulars of Mr. A. E. VIZARD, 12, Regent-street, Pall-mall, S.W. 1

Sales by Auction for the Year 1898.

MESSRS. JONES, LANG, and CO. beg to state that their SALES of ESTATES, Town and Country Residences, Freehold and Leasehold Investments, Building Land, and other Properties, will be held at the AUCTION MART, Tokenhouse-yard, City, in each MONTH of 1898. Particulars of properties intended for disposal should be sent at least three weeks previous to date of sale.

Messrs. Jones, Lang, and Co. also undertake Sales of Household Furniture, Farming Stock, and general Personal Effects, in town or country. Messrs. Jones, Lang, and Co.'s Printed Tabulated List of Warehouses, Offices, and general Business Premises to be Let or Sold, in the City of London and neighbourhood, can be had free on application.

Auction, Survey, and Estate Offices, 3, King-street, Cheapside, London, E.C. Branch Offices, 101, Leadenhall-street, E.C., and 27, Chancery-lane, W.C. Telegraphic address, "Wonderment, London."

TO CONTRACTORS, BUILDERS, WHARFINGERS, AND OTHERS.

BY ORDER OF THE KENSINGTON VESTRY.

NOTICE OF SALE BY TENDER OF FREEHOLD and LEASEHOLD WHARF PROPERTY, Queen's-road, Hammersmith.

The Vestry of the Parish of St. Mary Abbott's, Kensington, in the Administrative County of London, hereby give Notice that they are prepared to accept TENDERS for the PURCHASE, in separate lots, of their valuable FREEHOLD and LEASEHOLD RIVERSIDE WHARVES, in Queen's-road, Hammersmith.

The Leasehold Wharf is held by the Vestry direct from the Freeholder for a term of 99 years, from JUNE 24th, 1864 (leaving about 65 years unexpired), at an annual rental of £120.

Full possession will be given on completion of the purchase.

Forms and conditions of Tender, with plan, can be obtained at the Offices of the Vestry Clerk, or of the Surveyor, Town Hall, Kensington High-street.

Tenders must be delivered in a sealed cover at the Vestry Clerk's Office, on or before FOUR p.m. on SEPTEMBER 9th, 1898, endorsed "Wharf Tender," and signed by the party tendering.

WM. CHAMBERS LEETE, Vestry Clerk.

Town Hall, Kensington High-street, W.
